CONFIGURATION WARNINGS

Ident.: DSC-31-15-00000528.0021001 / 06 SEP 16
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

The following warnings and cautions appear in the lower part of the E/WD if the aircraft is not in takeoff configuration when the flight crew presses the T.O. CONFIG pb on the ECAM control panel or applies takeoff power.

WARNINGS / CAUTIONS	T.O. CONFIG TEST	T.O. POWER

GENERAL

Ident.: DSC-31-20-00000538.0001001 / 21 MAR 16
Applicable to: ALL

The system/status Display (SD) uses the lower ECAM DU to display :
- either an aircraft system synoptic diagram page
- or the STATUS page.

SYSTEM PAGES

Ident.: DSC-31-20-00000539.0005001 / 10 MAY 21
Applicable to: ALL

The lower ECAM DU can display 14 system pages (for description see relevant FCOM chapter):
- ENGINE (Secondary engine parameters)
- BLEED (Air bleed)
- CAB PRESS (Cabin pressurization)
- ELEC AC (AC Electrical power)
- ELEC DC (DC Electrical power)
- HYD (Hydraulic)
- C/B (Circuit Breakers)
- APU (Auxiliary Power Unit)
- COND (Air conditioning)
- DOOR/OXY (Doors/oxygen)
- WHEEL (Landing Gear, Braking, ground spoilers, etc.)
- F/CTL (Flight Controls)
- FUEL (Fuel)
- CRUISE (Cruise).

The flight crew may manually call up a system page for display on the lower ECAM DU, or the system may automatically display a page.
- Manually:
  - The flight crew can use the pushbutton on the ECAM control panel to call up any system page, except the CRUISE page, for display at any time
  - The corresponding pushbutton on the ECAM control panel lights up
  - A failure-related display automatically replaces a page the flight crew has manually called up.
- Automatically, related to a failure:
  - The relevant system page automatically appears, as soon as any fault or malfunction triggers a caution or warning message.

- Automatically, related to an advisory:
  - The relevant system page automatically appears, when a parameter drifts out of its normal range
  - The value (shown in green) pulses, as long as it is outside its limits
  - The advisory mode is inhibited in some flight phases.

- Phase 2: The F/CTL SD page replaces the WHEEL SD page for 20 s, when either flight crew moves the sidestick (more than 3 ° in pitch or roll), or when the rudder pedal deflection is more than 22 °
- The APU SD page appears, when the APU MASTER SW pb-swis ON. It disappears when APU RPM has been above 95 % for 10 s, or when the APU MASTER SW pb-sw switch is switched OFF
- The ENGINE SD page appears at the beginning of the start sequence, or when a flight crew selects CRANK. It disappears at the end of the start sequence.

For a description of the ENGINE and AIR indications that appear, when the SD is displaying the CRUISE page, see the relevant FCOM chapter.

The STATUS page provides an operational summary of the state of the aircraft. As illustrated in the following image, this operational summary includes all of the following:

(1) Limitations (speed, flight level): Blue

(2) Approach procedures: White

(3) Procedures (corrections to apply for landing): Blue

(4) Information: Green

(5) Cancelled caution: White

(6) Inoperative system: Amber

(7) Maintenance status: White

(8) The arrow appears if the data on the STATUS page overflows the left or right area of the page.

The flight crew can press the CLR pb, in order to scroll the display to view the overflow.

Note: The titles of the different parts of the display appear in white and underlined.

STATUS PAGE DISPLAY

The STATUS page appears when the flight crew presses the STS pb on the ECAM Control Panel (ECP).

The STATUS page automatically appears in abnormal operations if one of the following applies:
- The STATUS page is not empty, and the flight crew clears the last alert on the E/WD, or
- The STATUS page is not empty, and the flight crew selects CONF1 for approach, or
- The STATUS page is not empty, and the flight crew sets QNH/QFE on the EFIS Control Panel during descent.

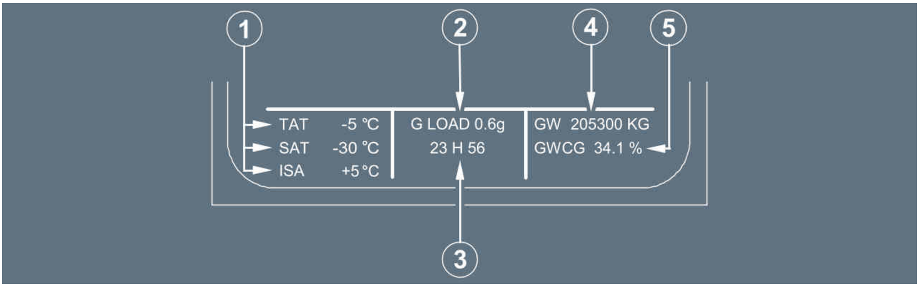
STS REMINDER

The STS reminder appears on the E/WD if both the following conditions apply:
- The STATUS page is not empty: The STATUS page displays message other than “CANCELLED CAUTION” or MAINTENANCE status.
- There is a MAINTENANCE status at engines shutdown.

The MAINTENANCE status can appear only when the aircraft is on the ground, before engine start or after engine shutdown.

PERMANENT DATA

Ident.: DSC-31-20-00017830.0004001 / 25 JUL 16
Applicable to: ALL



(1) Temperature
The screen displays Total Air Temperature (TAT), Static Air Temperature (SAT) in green. The difference between the SAT and the International Standard Atmosphere (ISA) temperature (Delta ISA ◁) is displayed in green, in STD BARO reference mode only.

(2) Messages - G LOAD

The screen displays either one of the following two items, one at a time:
- Load factor (G LOAD) in amber, when the value is above 1.4 g or below 0.7 g for more than 2 s.
  The G LOAD amber indication remains displayed 5 s after the excessive load occurrence.
  This display is inhibited during flight phases 1, 2, 3, 9 and 10.
- “CHECK SD”, “CHECK CAPT (F/O) PFD” or “CHECK CAPT (F/O) ND”, all in amber (*Refer to DSC-31-05-20 Cockpit Arrangement*).

Note: *The display of the feedback messages takes priority over the load factor indication.*

(3) UTC

The screen displays Universal Time Coordinated (UTC), synchronized with the cockpit clock, in green.

Note: *“40H00” default value is displayed in the case of cockpit clock failure at Central Maintenance Computer (CMC) power-up.*

(4) GW

The screen displays the gross weight (GW) as given by the FCMC, in green. The two last digits are dashed if accuracy is degraded. On ground, the indication is replaced by blue dashes, if no computed data are available.

(5) GWCG

The screen displays the gross weight center of gravity (GWCG), as given by the FCMC, in green. In case of an EXCESS AFT CG warning, the indication appears in red.

AMBER CROSSES "XX" ON THE SD

Ident.: DSC-31-20-00017856.0001001 / 21 MAR 16
Applicable to: ALL

If a parameter value on any SD page is not available for display, amber crosses "XX" appear instead of the value.

AMBER DASHES ON THE SD

Ident.: DSC-31-20-00015259.0001001 / 01 APR 14
Applicable to: ALL

If the accuracy of a parameter value on any SD page is degraded, amber dashes are displayed over the last digits.

Intentionally left blank

GENERAL

Ident.: DSC-31-25-10-00000567.0001001 / 21 MAR 16
Applicable to: ALL

If ECAM detects a failure :
- The E/WD displays warning or caution messages.
- The master warning or master caution lights light up (except in the case of a level 1 caution).
- The system sounds an aural signal (except in the case of a level 1 caution).
- The system display (SD) shows the system page for the affected system.
- The CLR pushbutton on the ECAM control panel lights up.

In addition, a local warning light controlled directly by the affected system can light up.

After completing remedial procedures, the flight crew must push the CLR pushbutton repeatedly until the displays return to their normal configurations :
- MEMO messages on the E/WD
- The system page related to the present flight phase on the SD.
- The CLR light on the ECAM control panel turned off.

Intentionally left blank

GENERAL

Ident.: DSC-31-27-00000588.0001001 / 09 MAY 23
Applicable to: ALL

The OEB reminder function provides operational help to the flight crew. This function enables the flight crew to clearly identify on the ECAM any procedure and STATUS message superseded by an OEB procedure.
When a situation causes an ECAM alert to trigger, a message informs the flight crew in real time if there is an OEB for the displayed ECAM alert and/or STATUS messages. As a result, the ECAM procedure and/or STATUS message is changed. In this case, a specific ECAM message informs the flight crew to refer to the QRH.

Note: *OEB reminder function needs to be activated by an appropriate maintenance procedure.*

DESCRIPTION

Ident.: DSC-31-27-00000589.0004001 / 09 NOV 20
Applicable to: ALL

The OEB reminder flag may apply to one of the following:
- ECAM procedure only
- ECAM procedure and corresponding status messages
- Status message only.

ONLY PROCEDURE AFFECTED

- The ECAM warning title remains the same
- All corresponding actions are deleted. Instead, the "REFER TO QRH/OEB PROC” message appears.
- The associated status messages on the ECAM system display remain the same.

(1) OFF / BRT knobs
Used to turn the ECAM DUs on and off, and to control their brightness (automatic adjustment of brightness for ambient light conditions is superimposed on this manual control).

Note: When the flight crew turns the UPPER DISPLAY knob to OFF, the engine/warning (E/W) display appears on the lower display unit (automatic transfer).

(2) System page pushbuttons

- Call up the corresponding system pages on the SD.
- Light up, when pushed for manual selection, or when an advisory is detected.
- Call up the aircraft system page corresponding to the present flight phase or the current warning when pushed a second time.

When only one ECAM display is on, the flight crew can display a system page for up to 3 min by holding the system page pushbutton.

- If an advisory condition arises, the relevant system page is not automatically displayed, but the pushbutton light pulses.
- If an ECAM warning is triggered, the relevant system page is not automatically displayed, and the system page pushbutton does not light up.

(3) RCL pushbutton

- When pressed, the E/WD displays all alerts previously cleared via the CLR pb that are still active.
- When pressed for more than 3 s, the E/WD displays:
  - All alerts previously cleared via the CLR pb that are still active
  - All alerts previously cancelled via the EMER CANC pb.

  Note: *This action on the RCL pb also suppresses the flight phase inhibition function until the next flight phase. As a consequence, all new alerts that should normally be inhibited will be displayed.*

Note: *If there is no alert to recall, the “NORMAL” message appears for 3 s on the E/WD.*

(4) STS (status) pushbutton

The flight crew pushes this pushbutton to display the STATUS page on the lower SD. The pushbutton remains lit, as long as the SD displays the STS page. If the system has no status messages, the status page displays “NORMAL” for 3 s.
The flight crew can clear the STATUS page by pushing the CLR pushbutton, or by pushing the STS pushbutton a second time.

When only one ECAM display is on :
- It displays the STATUS page only when the flight crew pushes the STATUS pushbutton and holds it. The flight crew can display the next STATUS page, if any, by releasing the pushbutton and pushing it again (before 2 s have elapsed). The new page then appears after a short delay.
- The flight crew can keep the STS pushbutton pressed to display the STATUS page for a maximum of 3 min, after which the ECAM automatically displays the engine/warning page.

(5) CLR pushbutton

This pushbutton remains lit as long as the E/WD is displaying a warning, or caution message or a status message on the SD.
If it is lit, pressing it changes the ECAM display.

(6) ALL pushbutton

When this pushbutton is pressed and held down, the SD successively displays all the system pages at 3 s intervals.
If the ECAM control panel fails, the flight crew can use this pushbutton to page through the system pages until the flight crew comes to the one the flight crew wants to look at. The flight crew releases the pushbutton then to select that page.

(7) EMER CANC pb

This pushbutton affects the following :

- Warnings :
  - Cancels (stops) an aural warning for as long as the failure condition continues.
  - Extinguishes the MASTER WARNINGS lights.
  - Does not affect the ECAM message display.
- Cautions :
  - Cancels any present caution (single chime, MASTER CAUTION lights, ECAM message) for the rest of the flight.

  The flight crew can press the RCL pb for more than 3 s in order to restore all the alerts previously canceled via the EMER CANC pb.
  All the alerts previously canceled via the EMER CANC pb automatically reappear on the E/WD in flight phase 1 or 2, immediately after the alignment of at least 2 IRs.

  Note: This pushbutton should only be used to suppress spurious MASTER CAUTIONS.

(8) TO CONFIG pb

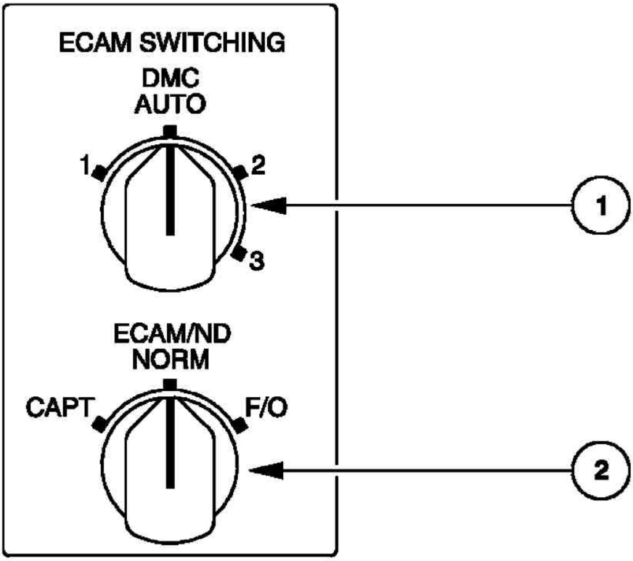
This pushbutton simulates the application of takeoff power. This is a test that triggers a warning, if the aircraft is not in takeoff configuration. (*Refer to DSC-31-15 Configuration Warnings*).
If the configuration is correct, the E/WD displays the “TO CONFIG NORMAL” message in the TO MEMO section.

Note: If the ECAM control panel fails, the CLR, RCL, STS, EMER CANC, and ALL pushbuttons remain operative, because their contacts are directly wired to the flight warning and display management computers.

ECAM SWITCHING PANEL

Ident.: DSC-31-30-00000601.0002001 / 07 FEB 11
Applicable to: ALL

ON MAIN INSTRUMENT PANEL



(1) Display Management Computer (DMC) selector switch

AUTO : DMC 3 supplies data to both ECAM DUs
In case of DMC 3 failure, the DMC 1 automatically takes over.
1 : DMC 1 replaces DMC 3
2 : DMC 2 replaces DMC 3
3 : DMC 3 supplies data to both ECAM DUs

(2) ECAM/ND transfer selector switch
Transfers the system/status display to either the captain's or the first officer's ND.
The "ECAM ON ND" is displayed on the lower ECAM display.

Note: If both ECAM DUs (E/WD and SD) fail, the flight crew can use this switch to transfer the E/W display to either navigation display.In this case the "ECAM ON ND" message is not displayed.

(1) MASTER WARN lights

- Flash red for level 3 warning.
- Accompanied by an aural warning (continuous repetitive chime, specific sounds or synthetic voice).

(2) MASTER CAUT lights

- Light up steady amber for a level 2 caution.
- Accompanied by a single chime.

These lights go out when :
- One pilot presses the light (except for some red warnings, such as the overspeed and stall warnings).
- The warning/caution situation is over.
- The pilot presses the CLR pushbutton on the ECAM control panel (except for some red warnings, such as the overspeed and stall warnings).
- The pilot presses the EMER CANC pushbutton on the ECAM control panel.

The aural warnings cease when :
- One pilot presses the MASTER WARN light (except for some red warnings, such as the overspeed and stall warnings).
- The warning situation is over.
- The pilot presses the EMER CANC pushbutton on the ECAM control panel.

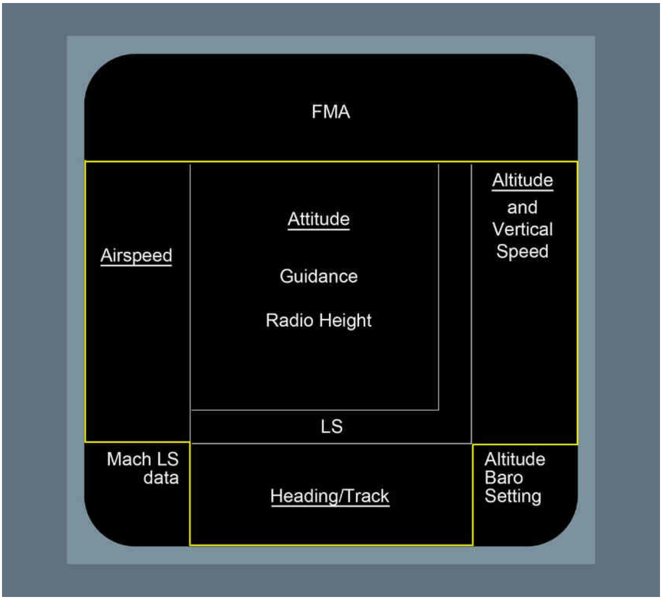
GENERAL

Ident.: DSC-31-40-00000603.0002001 / 15 NOV 21
Applicable to: ALL

The Primary Flight Display (PFD) provides the following information to the flight crew:
- Attitude and Guidance
- Airspeed
- Baro altitude, radio height and vertical speed
- Heading and Track
- FMGES modes (Flight Mode Annunciator)
- Vertical and Lateral Deviations
- Radio navigation information (ILS, FLS ◁ , GLS ◁ , SLS ◁ , DME).



FMA
Airspeed
Attitude
Guidance
Radio Height
Altitude and Vertical Speed
LS
Mach LS data
Heading/Track
Altitude Baro Setting

The FWC monitors such main parameters as: Attitude, heading, and altitude. Also *Refer to DSC-31-40 Flags and Messages Displayed on PFD - Schematic*.

(1) Sidestick order indication (white)
This is displayed, as soon as one engine is started.
It indicates the total of the pilot's and copilot's sidestick orders (shown here as left wing down, pitch up).

(2) Max Sidestick Deflection (white)
This is displayed, as soon as one engine is started.

(3) Ground Roll Guidance Command Bar (green)
This symbol is displayed when the aircraft is on the ground, or below 30 ft radio height, provided a localizer signal is available. It shows the flight director yaw orders, to keep the runway centerline.

(4) PFD 1 (2 or 3) message (magenta)
The display indicates which DMC drives the PFD. It appears only during tests on ground.

33

(1) Fixed Aircraft Symbol
This symbol is black, outlined in yellow.

(2) Roll Scale
This scale is white, and has markers at 0, 10, 20, 30, and 45 ° of bank.

(3) Roll Index (yellow)
This pointer indicates the bank angle. When the bank angle exceeds 45 °, all the PFD symbols except those for attitude, speed, heading, altitude, and vertical speed disappear. The display returns to normal when the bank angle decreases below 40 °.

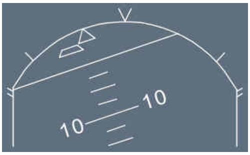
(4) Pitch Scale (white)
This scale has markers every ten degrees between 80 ° nose up and 80 ° nose down (every 2.5 ° between 10 ° nose down and 30 ° nose up). When pitch angle exceeds 25 ° nose up or 13 ° nose down, all the PFD displays except attitude, speed, speed trend, heading, altitude, and vertical speed disappear. Beyond 30 °, large red arrowheads indicate that the attitude has become excessive and show the direction to move the nose in order to reduce it. The display returns to normal when pitch angle becomes less than 22 ° nose up or 10 ° nose down.

(5) Flight Control Protection Symbols

The display shows these symbols (=) in green:
- On the roll scale to mark the bank angle protection availability
- On the pitch scale at 15 ° nose down or 30 ° nose up to mark the pitch limits.

An amber × replaces these symbols, if the corresponding protection is lost. (*Refer to DSC-27-20-20-30 Reconfiguration Control Laws - PFD Display*)

(6) Sideslip Index (yellow)
This trapezoidal index moves beneath the roll index. On ground, it represents the lateral acceleration of the aircraft. In flight, it shows sideslip (as computed by the PRIM computers). One centimeter of displacement indicates 0.2 g. The sideslip index is against its stop at 0.3 g.



In case of engine failure at take-off or go-around, the sideslip index changes from yellow to blue.

Note: *The sideslip target is blue if:*
- *Slats/Flaps are in CONF 1, 1+F, 2, 3 or FULL, and*
- *One thrust lever > MCT (≥ FLX if FLX or DERATED TO), and*
- *At least one engine > 1.3 EPR, and*
- *Engine thrust asymmetry > 0.25 EPR.*

In this case the sideslip index is called β target.

When this index is centered with the roll index, the sideslip equals the sideslip target for optimum aircraft performance.

Decel
Mach Number

ACTUAL AIRSPEED REFERENCE LINE AND SCALE

A white scale on a gray background moves in front of a fixed yellow reference line next to a yellow triangle to show airspeed. The minimum airspeed indication is 30 kt.

SPEED TREND

This pointer starts at the speed symbol. The tip shows the speed the aircraft will reach in 10 s if its acceleration remains constant. The pointer appears only when it is greater than 2 kt and disappears when it is less than 1 kt.

It also disappears if the FMGECs fail.

AIRSPEED TARGET (MAGENTA OR BLUE)

This symbol gives the target airspeed or the airspeed corresponding to the target Mach number.
The target airspeed is the airspeed computed by FMGEC in managed speed mode (magenta) or entered manually on the FCU for selected speed mode (blue).
When the target speed is off the speed scale, its value is displayed as numbers below or above the speed scale.

MACH NUMBER

This is displayed when it is greater than 0.5.

SPEED PROTECTION

This symbol indicates the speed at which high speed protection becomes active. This symbol is not displayed in pitch alternate or direct law because the protection is not available. (*Refer to DSC-27-20-20-30 Reconfiguration Control Laws - PFD Display*)

DECEL

The autobrake is active, and the aircraft decelerates as selected via the AUTO BRK mode selector.
This is displayed when the aircraft deceleration is at least 80 % of the selected deceleration. When the aircraft deceleration is less than 70 % of the selected deceleration, it disappears. The BSCU provides the DECEL information.

Note: *On a slippery runway, the A/SKID may be activated before the aircraft reaches 80 % of the deceleration. Therefore, the DECEL indication may not appear, even if the autobrake is active.*

ALTN & DIRECT LAW

MINIMUM SELECTABLE SPEED (VLS)

The top of the amber strip along the speed scale indicates this speed. It represents the lowest selectable speed providing an appropriate margin to the stall speed (*Refer to DSC-22_10-50-20 Characteristic Speeds*).
VLS information is inhibited from touchdown until 1 s after liftoff.

Note: *During the cruise phase, the calculation of the alpha protection speed is less accurate than the calculation performed in other flight phases. Therefore, this alpha speed protection may be above the real alpha protection speed. In this case, the black and amber strip of the alpha protection speed extends over the VLS. As a result, VLS is not visible. However, all protections are still available.*

ALPHA PROTECTION SPEED

The top of a black and amber strip along the speed scale indicates this speed.
It represents the speed corresponding to the angle of attack at which alpha protection becomes active (*Refer to DSC-27-20-10-20 Protections - High Angle of Attack Protection*).
It is displayed when in pitch normal law.

ALPHA MAX SPEED

The top of a red strip along the speed scale indicates this speed. It represents the speed corresponding to the maximum angle of attack that the aircraft can attain in pitch normal law (*Refer to DSC-27-20-10-20 Protections - High Angle of Attack Protection*).
It is displayed when in pitch normal law.

MAXIMUM ALLOWABLE SPEED (VMAX)

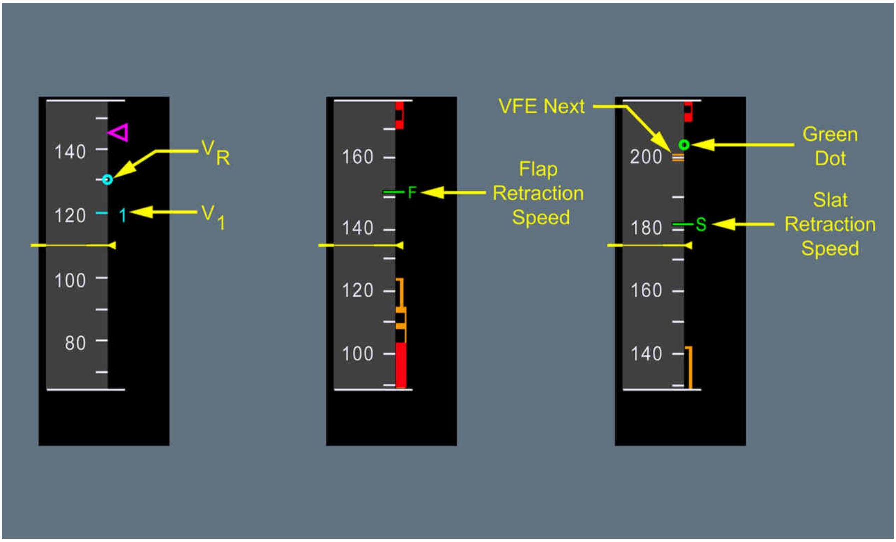
The lower end of a red and black strip along the speed scale defines this speed.

It is the lowest of the following:
- VMO or the speed corresponding to MMO
- VLE
- VFE.

(*Refer to DSC-22_10-50-20 Characteristic Speeds*)

STALL WARNING SPEED (VSW)

The top of a red and black strip along the speed scale defines this speed.
It is the speed corresponding to the stall warning (*Refer to DSC-27-20-10-20 Protections - High Angle of Attack Protection*).
VSW information is inhibited from touchdown until 5 s after liftoff.
It is displayed when operating in pitch alternate or pitch direct law.



DECISION SPEED (V1)

This speed represented by the number (1) is manually inserted by the flight crew in the MCDU.
When it is off the scale, the upper part of the scale shows it in numbers.
It disappears after liftoff (*Refer to DSC-22_10-50-50 Other Speeds*).

ROTATION SPEED (VR)

VR is entered on the PERF TAKEOFF page of the MCDU and is indicated by a cyan circle (o).
This cyan circle is visible during takeoff.

Note: *1. V2 is represented by the target speed index during takeoff.*
2. V2 is manually inserted by the flight crew via the MCDU.

MINIMUM FLAP RETRACTION SPEED

This is represented by a F. It appears when the flap selector is in position 2 or 3. (*Refer to DSC-22_10-50-20 Characteristic Speeds*)

MINIMUM SLAT RETRACTION SPEED

This is represented by a S. It appears when flap selector is in position 1. (*Refer to DSC-22_10-50-20 Characteristic Speeds*)

GREEN DOT (ENGINE-OUT OPERATING SPEED IN CLEAN CONFIGURATION)

This green dot (•) appears when the aircraft is flying in clean configuration.

It shows the speed corresponding to the best lift-to-drag ratio.

VFE NEXT

The VFE next symbol is an amber double bar (=) showing the VFE corresponding to the next FLAPS lever position.
It appears when the aircraft altitude is below 20 000 ft (*Refer to DSC-22_10-50-30 Limit Speeds*).

QNH 1020

(1) Altitude Indication
This appears both as a white moving scale and as a green digital readout on a grey blackground. “NEG” appears in the window in white for negative altitudes. The altitude window changes from yellow to amber, if the aircraft deviates from the FCU-selected altitude or flight level.
On any approach for which minimum value is entered in the FMGEC, the altitude numbers change from green to amber, when the aircraft goes below the minimum.

(2) Target Altitude or Selected Flight Level Symbol (blue or magenta)

This symbol shows the FCU-selected altitude (if QNH BARO reference is selected), or the selected flight level (if STD BARO reference is selected).

When the FMGEC operates in the vertical managed mode, this symbol is in magenta, if it represents a flight plan altitude constraint that the FMGEC will follow. If the target altitude or flight level is on the scale, the symbol is displayed and the numerical value appears inside the symbol.

If the target altitude or flight level is off the scale, the symbol is not displayed, and the numerical value appears above or under the scale.

(3) Barometric Reference

The display shows “STD” or it shows “QNH” and the numerical setting in hectoPascals or inches of mercury.

It pulses when the selection made by the flight crew is not correct (STD not selected above transition altitude in climb or STD still selected in approach below transition level).

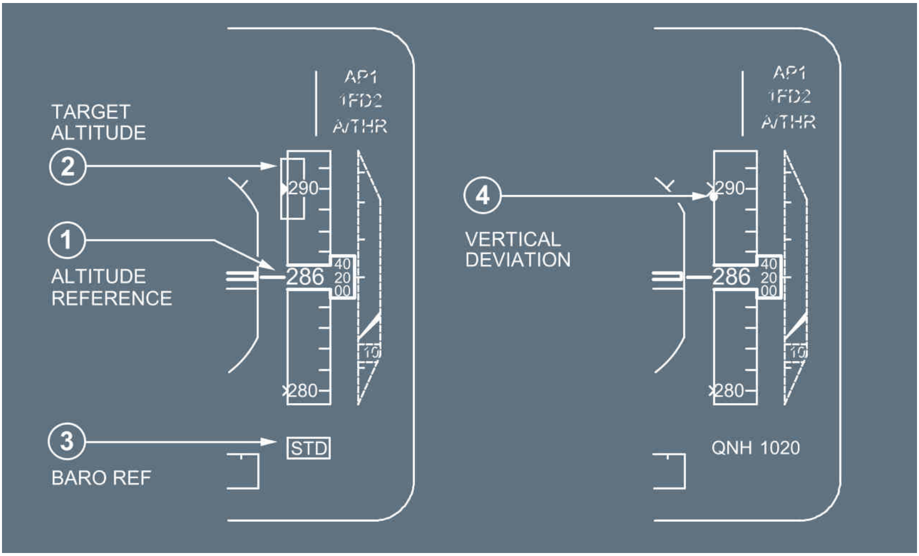
(4) Vertical Deviation

This symbol appears next to the altitude corresponding to the theoretical vertical profile computed by the FMGEC. It is displayed from the top of descent down to the MAP or to the final intercept altitude.

This symbol can either be a magenta circle or a green filled circle, depending on the installed EIS standard. In both cases, the symbol has got the same meaning.

The flight crew can read the vertical deviation directly from the altitude scale. The range is ±500 ft. When the vertical deviation value exceeds ±500 ft, the symbol stays at the range limit but changes to a filled half circle and the PROG page displays the exact value.

Ident.: DSC-31-40-A-00000653.0016001 / 16 SEP 14
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO



(1) Altitude Indication
This appears both as a white moving scale and as a green digital readout on a grey blackground. “NEG” appears in the window in white for negative altitudes. The altitude window changes from yellow to amber, if the aircraft deviates from the FCU-selected altitude or flight level.
On any approach for which minimum value is entered in the FMGEC, the altitude numbers change from green to amber, when the aircraft goes below the minimum.

(2) Target Altitude or Selected Flight Level Symbol
This symbol shows the FCU-selected altitude (if QNH BARO reference is selected), or the selected flight level (if STD BARO reference is selected).
The target altitude is displayed in blue when the vertical guidance is either selected or managed.
The target altitude is displayed in white when a vertical approach mode is engaged (G/S*, G/S, F-G/S* ◁ , F-G/S ◁ , FINAL APP ◁ , LAND, FLARE, ROLL OUT). The aircraft disregards the target altitude when a vertical approach mode is engaged.
The target altitude is displayed in magenta when it represents an altitude constraint of the F-PLN while in managed vertical guidance.

If the target altitude or flight level is on the scale, the symbol is displayed and the numerical value appears inside the symbol.
If the target altitude or flight level is off the scale, the symbol is not displayed, and the numerical value appears above or under the scale.

(3) Barometric Reference
The display shows “STD” or it shows “QNH” and the numerical setting in hectoPascals or inches of mercury.
It pulses when the selection made by the flight crew is not correct (STD not selected above transition altitude in climb or STD still selected in approach below transition level).

(4) Vertical Deviation
This symbol appears next to the altitude corresponding to the theoretical vertical profile computed by the FMGEC. It is displayed from the top of descent down to the MAP or to the final intercept altitude.
This symbol can either be a magenta circle or a green filled circle, depending on the installed EIS standard. In both cases, the symbol has got the same meaning.
The flight crew can read the vertical deviation directly from the altitude scale. The range is ±500 ft.

When the vertical deviation value exceeds ±500 ft:
- The symbol stays at the range limit, but changes to a filled half circle, and
- The value is indicated on the left of the symbol in hundreds of feet, and
- The MCDU PROG page displays the exact value.

(1) Radio Height

This quantity appears when it is less than 2 500 ft.

- If a DH has been entered, the radio height appears:
  - In green, when DH +100 ft < RA < 2 500 ft
  - In amber, when RA < DH +100 ft.

  If "NO" is entered as the DH on the MCDU APPROACH page, 0 ft becomes a default value.

  When the aircraft reaches the decision height selected on the MCDU, DH letters flash amber for three seconds, then stay in amber above the radio height indication.
- If no DH has been entered or if both FMGECs fail, the radio height appears:
  - In green, when 400 ft < RA < 2 500 ft
  - In amber, when RA ≤ 400 ft.

The radio height indication changes every 10 ft down to 50 ft, then every 5 ft down to 10 ft, then every foot.

(2) Landing Elevation (brown)

The top of the brown surface on the altitude scale represents the landing elevation at the flight-planned destination.

It is displayed:
- During flight phases 7 and 8, and
- If the QNH reference mode is selected.

Ident.: DSC-31-40-A-00000660.0003001 / 13 JAN 14

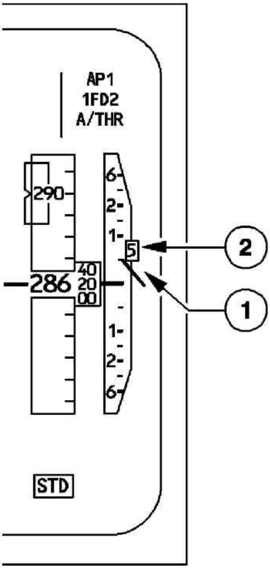
Ident.: DSC-31-40-00000664.0002001 / 21 MAR 17
Applicable to: ALL

The displayed vertical speed information is normally based on both inertial and barometric data. If inertial data is not available, it is automatically replaced by barometric information. In this case, the window around the numerical value becomes amber.



(1) Analog pointer
This pointer, which is normally green, points to a white vertical speed scale displayed on a grey background and graduated at intervals of 500 ft/min.
If the V/S is greater than 6 000 ft/min, the pointer stays at the end of the scale.

(2) Digital indication
This number, normally green, is the vertical speed in hundreds of feet per minute.
It disappears if the vertical speed is less than 200 ft/min.

The analog pointer and the digital indication become amber, if :
- V/S is greater than 6 000 ft/min, (climb or descent)
- V/S is greater than 2 000 ft/min, during descent when 1 000 ft < RA < 2 500 ft, or
- V/S is greater than 1 200 ft/min, during descent and RA < 1 000 ft.

Note: *For TCAS refer to DSC / 34-SURV / 60.TCAS / 20.Controls and Indicators.*

TRK-FPA SELECTED

(1) Heading Reference Line and Scale
A white scale on a grey background moves in front of a fixed yellow reference line to show the actual magnetic heading.

(2) Selected Heading or Track Index (blue)

The pointer indicates the heading or track selected on the FCU HDG-TRK counter.
The index is replaced by digits on the right or left side of the scale, when the selected value is off the scale.
If the FD pb is OFF, a second heading or track symbol appears on the horizon line and markers are displayed every 10 °.

(3) Actual Track Symbol

This symbol is a small green diamond.

(4) True heading (blue)

At high latitude above 82.5 ° North or 60.5 ° South (or entering the north, magnetic polar region latitude 73.5 ° N and longitude between 117.5 ° W and 92.5 ° W), the ADIRUs replace magnetic heading by true heading on the EFIS and DDRMI.
When the aircraft is close to these regions (latitude above 82 ° North or 60 ° South or approaching the north polar region: 73 ° N and longitude between 90 ° W and 120 ° W), the ADIRU causes the "SELECT TRUE REF" message to appear on the ND, thereby requesting a change in the north reference.
In true heading configuration at slats extension, « TRUE » will flash for 9 s then remain steady.

FLIGHT PATH VECTOR

Ident.: DSC-31-40-00000675.0003001 / 03 DEC 19
Applicable to: ALL

The Flight Path Vector (FPV) is a flight reference with the TRK and FPA as basic guidance parameters. When TRK/FPA is selected on the FCU, the FPV appears on the PFD.

INFORMATION PRESENTATION

The FPV appears on the PFD as a symbol, known as the "bird". The "bird" indicates the track and flight path angle in relation to the ground.
The track is indicated on the PFD by a green diamond on the compass, in addition to the lateral movement of the "bird" in relation to the fixed aircraft symbol. On the ND, the track is indicated by a green diamond on the compass scale. The difference in angle between track and heading indicates the drift.
The flight path angle is indicated on the PFD by the vertical movement of the "bird" in relation to the pitch scale.
With the Flight Directors (FDs) selected on, the Flight Path Director (FPD) replaces the HDG-VS Flight Director (FD). With both FDs pb set to off, the blue track index appears on the PFD horizon.

DRIFT
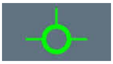
WIND

Example:
The aircraft flies:
- A track of 019° (heading 360°, wind from the left)
- A flight path angle of minus 11°

FLIGHT PATH VECTOR (FPV)



The FPV appears when the pilot selects TRK/FPA on the FCU.
The flight path vector represents the lateral and vertical trajectory of the aircraft with respect to the ground.

- On the lateral scale it indicates the aircraft's track.
- On the vertical scale it indicates the aircraft's flight path angle.

USE OF FPV

The "bird" is the flight reference that should be used when flying a stabilized segment of trajectory, e.g. a Non Precision Approach flown without the FLS function ◁ or visual circuit.

In dynamic maneuvers, the "bird" is directly affected by the aircraft inertia and has a delayed reaction. As a result, the "bird" should not be used as a flight reference in dynamic maneuvers. *Refer to FCTM/AS-BIRD Introduction* for more information.

GUIDANCE

Ident.: DSC-31-40-00000678.0001001 / 13 JAN 14
Applicable to: ALL

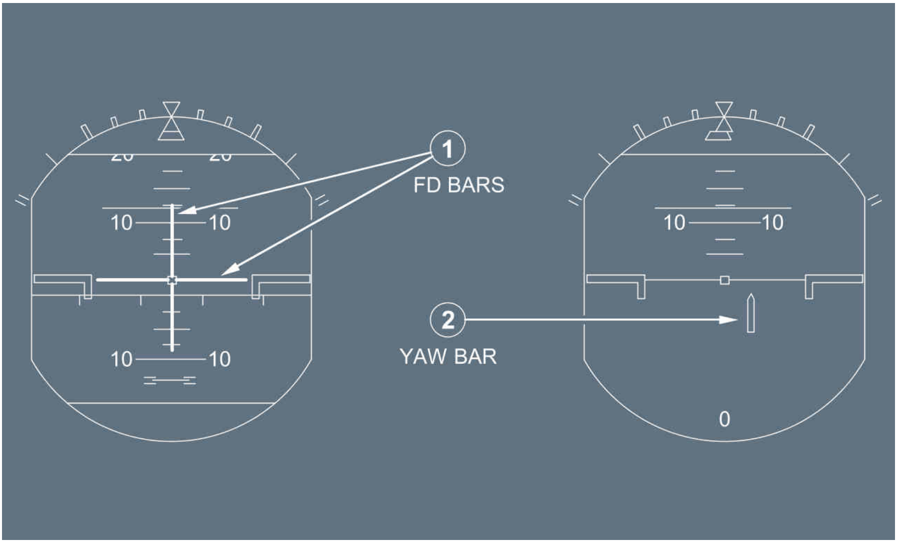
Two completely different flight director modes are available, each with its own characteristic symbols. The symbol displayed corresponds to the basic operating reference the pilot has selected – either HDG V/S or TRK FPA.
In normal operation PFD1 displays FD1 orders.
If FD1 fails, PFD1 automatically displays FD2 orders, and on the PFD1 the FD2 indication in the right column of the FMA flashes for a few seconds.
The same applies for FD2 orders normally displayed on PFD2.

IF THE CREW HAS SELECTED HDG V/S TO BE THE BASIC REFERENCE:

The PFD displays pitch and roll bars in green. They automatically move out of view at touchdown in ROLL OUT mode.

They flash for 10 s and then remain steady in the following conditions:
- reversion to the HDG V/S basic mode (manually or automatic)
- change of selected flight level when the autopilot is already engaged in ALT CAPTURE mode
- loss of LOC or G/S in LAND mode or loss of LAND mode
- at the first AP or FD engagement.

The PFD displays a yaw bar in green below 30 ft radio height if a localizer signal is available:
- during takeoff (in RWY mode)
- upon landing (in FLARE and ROLL OUT mode).



(1) FD Crossed Bars (green)

(2) Yaw Bar (green)

THE CREW HAS SELECTED TRK FPA AS THE BASIC REFERENCE:

An inertial flight path vector defines the aircraft's horizontal and vertical track, taking wind effect into account.
An associated flight path director symbol guides the flight crew onto the vertical and horizontal flight path targets.

Glide Slope Deviation Scale and Index
1
Localizer Deviation Scale and Index

(1) Localizer Deviation Scale and Index

(2) Glide Slope Deviation Scale and Index
Deviation scales appear as soon as the flight crew pushes an LS pushbutton switch on the EFIS control panel. Deviation indexes appear when the glide slope and localizer signals are valid if deviation scales are displayed.
When a deviation index is out of the displayed range, only half a symbol appears at the end of the scale.
The LOC scale flashes and continues to flash if the deviation exceeds 1/4 dot for two seconds while the aircraft is between 15 ft and 1 000 ft, and CAT 2 or CAT 3 capability displayed on the FMA, and either LOC, LAND, or FLARE is engaged. The glide scale flashes and continues to flash if the deviation exceeds one dot for two seconds (above 100 ft RA).
LOC and the glide scale half index symbols flash and continue to flash when the deviation exceeds two dots for two seconds.
One dot represents a deviation of ±0.8 ° on the localizer scale and ±0.4 ° on the glide slope scale.

ILS / GLS ◁ / SLS ◁ INFORMATION

The following information appears on the PFD, when the crew has selected an ILS frequency or GLS/SLS channel and course and pressed the LS pb:

- ILS / GLS / SLS identification as decoded by the MMR
- ILS frequency / GLS / SLS channel
- For ILS: DME distance if the ILS has a DME
- For GLS / SLS: distance to runway threshold computed by the MMR.

ILS / GLS ◁ / SLS ◁ COURSE POINTER

This pointer appears on the PFD, when the crew has selected an ILS frequency / GLS / SLS channel and course and pressed the LS pb.
It is a dagger-shaped symbol on the heading scale.
The ILS / GLS / SLS course pointer is replaced by digits on the right or left hand side of the heading scale (in a white box), when the ILS / GLS / SLS course value is outside the displayed portion of the heading scale.

MARKER INDICATIONS

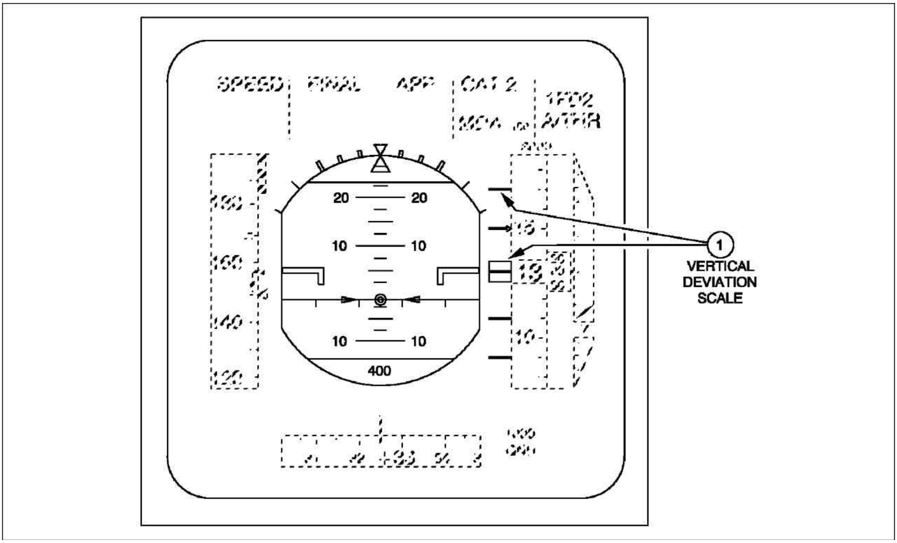
OM appears, when the aircraft flies over the outer marker
MM appears, when the aircraft flies over the middle marker
IM appears, when the aircraft flies over an airways marker beacon or the ILS / GLS ◁ inner marker.

ILS / GLS ◁ / SLS ◁ MESSAGE

This flashes amber, when the APPR mode is armed and the LS pb is not selected.

Ident.: DSC-31-40-B-00000695.0006001 / 14 FEB 11
Applicable to: LV-KHT, LV-KHU

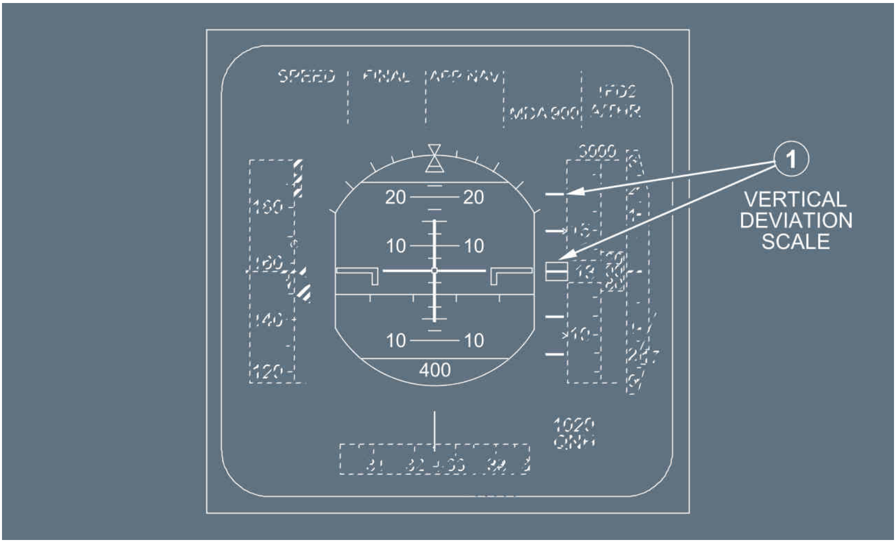
NON PRECISION APPROACH



(1) Vertical Deviation Scale and Index
The vertical deviation scale and index appear when in approach phase and, when either the FINAL APP mode is armed/engaged, or a non-LS approach has been entered. They are displayed in the approach or go-around phase, until the MDA has been reached, or the MAP or the runway has been sequenced. They give the vertical deviation with respect to the trajectory defined by the FMGEC.
Each index scale graduation represents 100 ft. The range is ±200 ft.

Note: If the LS pb-sw is pressed, glide deviation has priority over vertical deviation information. As long as V/DEV display conditions are met, and the LS pb-sw is selected, an amber V/DEV message flashes above the glide scale.

NON PRECISION APPROACH



(1) Vertical Deviation Scale and Index

The vertical deviation scale and index appear when in approach phase and, when either the FINAL APP mode is armed/engaged, or a non-LS approach has been entered. They are displayed in the approach or go-around phase, until the MDA has been reached, or the MAP or the runway has been sequenced. They give the vertical deviation with respect to the trajectory defined by the FMGEC.
Each index scale graduation represents 100 ft. The range is ±200 ft.

When the vertical deviation value exceeds ±200 ft:
- The symbol stays at the range limit, but changes to a half rectangle, and
- The value is indicated on the left of the symbol in hundreds of feet, and
- The MCDU PROG page displays the exact value.

Note: *If the LS pb-sw is pressed, glide deviation has priority over vertical deviation information. As long as V/DEV display conditions are met, and the LS pb-sw is selected, an amber V/DEV message flashes above the glide scale.*

(1) Rising Runway Symbol (magenta)

If:
- The localizer signal is valid
- The radio height is available, and
- The yaw bar is not displayed

at 200 ft RA the runway symbol starts from the bottom of the pitch scale. Its vertical deviation is driven by the radio height and its lateral deviation by the localizer.

Note: *When the rising runway option is installed, the lower line of the attitude sphere does not move for ground reference.*

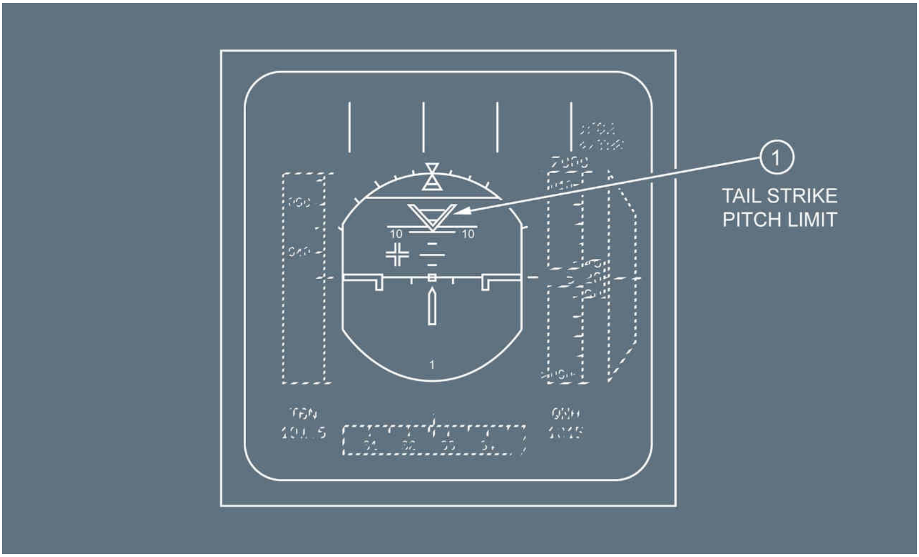
FLIGHT MODE ANNUNCIATOR

Ident.: DSC-31-40-00000697.0003001 / 18 MAY 22
Applicable to: ALL

For a detailed discussion of legends and messages that may appear during FMGES operations, see AFS chapter (*Refer to DSC-22_30-80-20 FMA Display*).

TAIL STRIKE PITCH LIMIT INDICATOR

Ident.: DSC-31-40-00017879.0008001 / 21 MAR 16
Applicable to: ALL



(1) Tail Strike Pitch Limit
The pitch limit indicates the maximum pitch attitude to avoid the tail strike risk at takeoff and landing. During takeoff, the indication progresses from the pitch limit value with main landing gear compressed, to the pitch limit value with main landing gear extended. The indication is removed when the tail strike risk disappears.
During landing, the indication is a fixed value corresponding to the main landing gear compressed. The indication appears at 400 ft radio height.

ALTITUDE ALERT

Ident.: DSC-31-40-00000702.0003001 / 17 MAR 11
Applicable to: LV-KAN, LV-KAO

The FWC generates an altitude warning (C chord sound, and PFD's altitude window pulses in yellow or flashes in amber), when the aircraft approaches a preselected altitude or flight level or when it deviates from its selected altitude or flight level.
This warning results from a comparison between the altitude (ADIRS) and the preselected altitude displayed on the FCU.

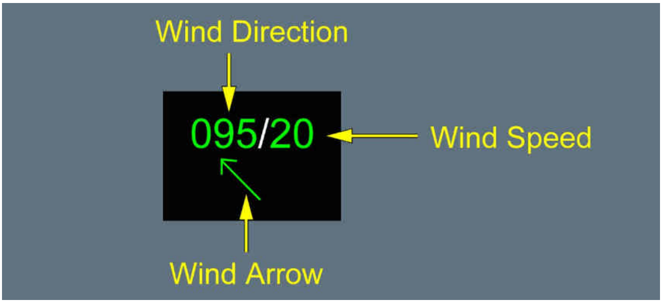
WIND INDICATIONS

The ADIRS provides the wind direction and speed.



The wind direction is in degrees, and wind speed is in knots. The numerical value of the wind direction is given relative to True North. The ND displays a green arrow when one of the following conditions occur:

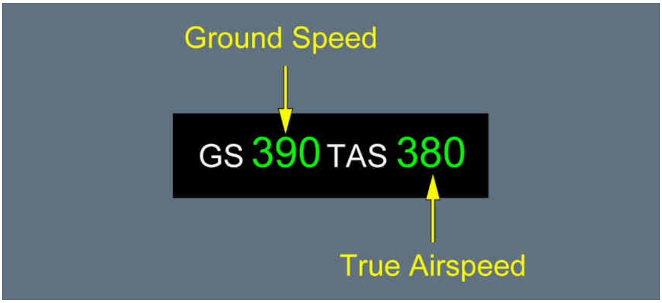
- Wind speed exceeds 2 kt, or
- TAS is above 100 kt.

The green arrow indicates the wind direction relative to Magnetic North.

When wind data is not received, either wind speed or direction, dashes replace the numbers on the display.

SPEED INDICATION

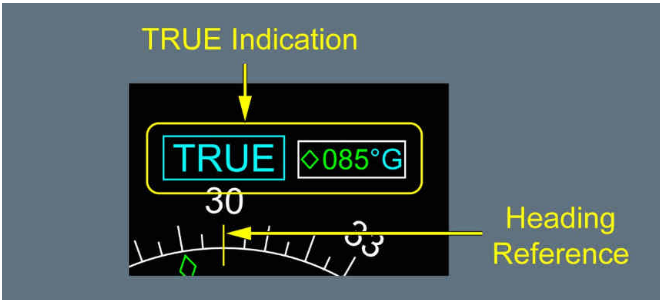
The ADIRS provides the Ground Speed (GS) and True Airspeed (TAS) of the aircraft, in knots.



CURRENT TRACK

Indicates the current aircraft track.
The track refers to True North or Magnetic North, depending on the MAG/TRUE selection on NORTH REF pb-sw.

AIRCRAFT HEADING



TRUE INDICATION

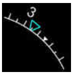
Indicates that the heading refers to the True North.
This indication flashes for 9 s, or until the slats are extended, then it remains steady.
Refer to DSC-22_20-60-130-Polar Navigation.

Appears when the heading refers to the True North, and the latitude is above 65 °N or 65 °S. This corresponds to the numerical form of the grid track.

HEADING REFERENCE

Indicates the current aircraft's heading on the moving white compass rose.
The heading refers to True North or Magnetic North, depending on the MAG/TRUE selection on NORTH REF pb-sw.

SELECTED HEADING/TRACK



Indicates the heading (track) that the flight crew selects on the FCU. Appears when the HDG (TRACK) mode is engaged.

BEARING POINTER

Indicates the bearing of the selected NDB1.
Appears when flight crew selects ADF1 ◁ on EFIS CP.

Indicates the bearing of the selected NDB2.
Appears when flight crew selects ADF2 ◁ on EFIS CP.

Indicates the bearing of the selected VOR1.
Appears when flight crew selects VOR1 on EFIS CP.

Indicates the bearing of the selected VOR2.
Appears when flight crew selects VOR2 on EFIS CP.

Appears when the ND display mode is ARC or ROSE NAV, and the computer detects a mismatch between the aircraft North reference and the VOR North reference.
In this case, the VOR raw bearing is corrected with magnetic variation at the aircraft present position (*Refer to DSC-22_20-60-130 General*).

If reception of a beacon ceases, or if the receiver fails, the associated bearing pointer disappears.

AIRCRAFT SYMBOL

Fixed and centered in the display. The aircraft symbol points to the heading reference (yellow lubber line).

DME Distance
Manual Tuning

ACTIVE NAVIGATION STATION

VOR1

Indicates the VOR receiver currently displayed on the ND.
The flight crew can display the VOR1 or VOR2 via the EFIS CP (*Refer to DSC-31-50 EFIS Control Panel*).

ADF1

Indicates the ADF ◁ receiver currently displayed on the ND.
The flight crew can display the ADF1 ◁ or ADF2 ◁ via the EFIS CP (*Refer to DSC-31-50 EFIS Control Panel*).

IDENTIFIER OR FREQUENCY

TOU

Indicates the VOR ident.

If the VOR ident is not valid, the ND displays the following elements (if valid) instead, by order of priority:
- The DME ident, or
- The VOR frequency, or
- The DME frequency.

TOE	Indicates the NDB ident (ADF ◁). If the NDB ident (ADF ◁) is not valid, the ND displays the NDB frequency instead.

MANUAL TUNING

R	The flight crew manually tuned the navaids via the RMP.
M	The flight crew manually tuned the navaids via the MCDU.

When the navaid is automatically tuned by the FMGEC, no indication is displayed.

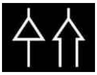
VOR BEARING CORRECTION

Indicates the VOR bearing correction, when the VOR reference from the FMGEC database (TRUE or MAG) is different from the current aircraft flying reference (TRUE or MAG).

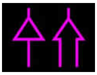
CORR	When in ROSE NAV or ARC mode, the VOR bearing is corrected for magnetic variation.
MAG	When in ROSE VOR or ROSE LS mode, the VOR reference is MAG. No correction is applied to bearing. *Refer to DSC-22_20-60-130 General*.
TRUE	When in ROSE VOR or ROSE LS mode, the VOR reference is TRUE. No correction is applied to bearing. *Refer to DSC-22_20-60-130 General*.

REMINDER INFORMATION

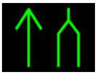
The reminder information enables to identify the pointer associated with a navaid currently displayed on the ND.



Indicates the pointer associated with the VOR1 or the VOR2.



Indicates, in ROSE NAV or ARC mode, when the VOR North reference (TRUE or MAG) is different from the current aircraft North reference (TRUE or MAG).



Indicates the pointer associated with the ADF1 ◁ or ADF2 ◁ .

DME DISTANCE

The DME distance only appears when the selected navaid is a VOR/DME.

17.5 NM	Indicates the DME distance of the aircraft. ADF ◁ identification and DME distance never appear at the same time.

The DME distance is not computed.

RANGE MARKS

Range value (10 to 320 NM) are displayed at a quarter and at a half of the selected range via EFIS CP.

CHRONOMETER

These numbers appear when the onside chronometer is started after the flight crew presses the onside CHRONO pb on the glareshield. For more information, *Refer to DSC-31-50 Chronometer (Glareshield)*.

Indicates the elapsed time in minutes and seconds (0 to 59 min 59 s).

Indicates the elapsed time in hours and minutes (1 h to 99 h 59 min).

SELECTED ILS COURSE POINTER

(1) ILS Course Pointer (Magenta)

This symbol points at the selected ILS course.
The ILS course is either selected by the FMGC (autotuned or manually) or manually selected by the flight crew via the RMP backup mode.

(2) Localizer Deviation Bar (Magenta)

This bar moves laterally with respect to the course pointer. Its scale has two white dots on each side of the zero deviation. Each dot corresponds to a deviation of approximately ± 0.8 °.
If the lateral deviation exceeds 1/4 dot (0.2 °) above 15 ft RA, both the bar and the scale flash.

(3) Glide Deviation (Magenta)

This diamond moves on a vertical scale consisting of two white dots on each side of the yellow reference line. Each dot corresponds to deviation of approximately ± 0.4 °.
If the deviation exceeds one dot above 100 ft RA, both the scale and the diamond flash.

(4) Selected ILS Information

This area displays the ILS frequency (magenta), selected course (magenta), and identification (magenta).

(5) ILS APP Message (Green)

This message appears when:
- The flight crew selects an ILS approach on the MCDU, and
- The FMS flight phase is DES, APPR, or GO-AROUND, or the FMS phase is CRZ and the along track distance to destination is less than 250 NM.

Note: *ILS 1 information appears on PFD 1 and ND 2.*
ILS 2 information appears on PFD 2 and ND 1.

RANGE MARKS AND VALUES

The values displayed on the ND are:

In ROSE NAV mode	1/4 of the selected range for the inner circle
	1/2 of the selected range for the heading scale circle
In ARC mode	1/4 of the selected range for the first inner arc
	1/2 of the selected range for the second inner arc
	3/4 of the selected range for the third inner arc

Ident.: DSC-31-45-B-00024243.0001001 / 28 MAY 20
Applicable to: ALL

FLIGHT PLAN

The flight crew can use the MCDU to select all of the following types of flight plan:

- The active flight plan (the flight plan the aircraft follows when the NAV mode is engaged) is indicated by a continuous green line. The ND indicates only the part of the flight plan that is ahead of the aircraft. In addition, the ND indicates the waypoints that are still to be overflown and the waypoint that the aircraft left from.
  The ND does not indicate a SID or a STAR, except for the last waypoint of the SID and the first waypoint of the STAR, when the selected range is 160 or 320 NM.
  If the primary flight plan is not active, it is indicated by a dotted green line.
- Missed approach procedure
  The missed approach procedure is indicated by a continuous blue line.
- Alternate
  The flight plan to the alternate is indicated by a dashed blue line.

  The missed approach and the alternate flight plan appear when:
  - In ARC or ROSE NAV mode, a missed approach waypoint or an alternate flight plan waypoint is displayed on the onside MCDU
  - In PLAN mode, a missed approach or alternate waypoint is displayed in the 2L field of the onside MCDU.
- The secondary flight plan
  The ND continues to display the active flight plan. The secondary flight plan is indicated by a continuous white line.
- Temporary flight plan
  The revised portion of the flight plan is indicated by a dotted yellow line.
- Flight plan capture
  When the aircraft is off the primary flight plan and flies toward it in HDG mode with the NAV mode armed, the ND indicates the new active flight plan as a continuous green line, if the FMGEC computed the intercept path.
  The part of the flight plan before the interception point is indicated as a dotted green line.

Level Symbol + T/D Symbol
ALT CSTR
Intercept Point

The ND can display all of the following types of waypoints:

- Flight plan waypoints
  The ND displays these as green diamonds (white, for TO waypoints). When the flight crew selects the WPT option on his EFIS control panel, all waypoints other than flight plan waypoints are displayed in magenta.
- Pseudo waypoint
  Point of the flight path where the aircraft is predicted to reach a selected altitude or speed (*Refer to DSC-22_20-40-30 Predictions Displayed on the Navigation Display*).
- Constraint values
  When the flight crew presses the CSTR pb on the EFIS CP, the ND displays the constraints values below the waypoint ident.

  If there are several constraints for the same waypoint, the ND displays the constraints in the following order of priority:
  - The altitude constraint

    The ND displays the altitude constraint value:
    - In FL, when the altitude is above the transition altitude or the barometric setting is set to STD
    - In feet in all other cases.
  - The speed constraint
    The ND displays the speed constraint value in knots or as a Mach number.
  - The time constraint.

  Note: *1. For ILS approaches, the ND only displays speed and time constraints at the FAF waypoint up to destination.*
  2. The ND is limited to the display of 3 lines of constraints for each waypoint. Therefore immediately after the fourth constraint is applied on the FMS:
  - With FMS Thales, the fourth constraint is not displayed on ND
  - With FMS Honeywell, the waypoint ID and all associated constraints disappear from the ND.
  In both cases, all constraints are correctly managed by the FMS. The flight crew can refer to the MCDU F-PLN page to check all constraints associated with a waypoint.

  The constraint value and the constraint symbol have identical color coding.

  Note: *In PLAN mode, and at the MRP waypoint, the ND also displays the track and the distance to the next waypoint.*

Ident.: DSC-31-45-B-00024245.0001001 / 28 MAY 20
Applicable to: ALL

TO WAYPOINT

This is the next waypoint that the aircraft will overfly.

L2 With the FMS standard Release 1A, when a DIR TO with ABEAM PTS is performed, the DIR TO waypoint appears on the top of the screen, instead of the NEXT ABEAM waypoint.

L1 This area of the screen also indicates all of the following:
- Waypoint identification
- Track to go
- Distance to go
- Estimated time of arrival, with the assumption that the aircraft will directly fly from its present position to the TO waypoint at the current ground speed.

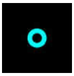
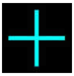
NAVAIDS

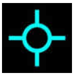
The display uses all of the following specific symbols for NAVAIDs:



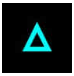
DME or TACAN



VOR



VOR/DME



NDB

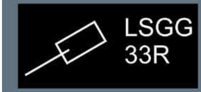
The symbol can appear in all of the four following colors:
- In green if the NAVAID is a current waypoint of the flight plan
- In white if it is the TO waypoint
- In blue when the NAVAID is tuned for display, either automatically by the FMGEC, or manually via the MCDU
- In magenta when the NAVAID is not part of the flight plan and is displayed as an option (corresponding option pushbutton pressed on the FCU EFIS control panel).

Ident.: DSC-31-45-B-00024248.0001001 / 28 MAY 20
Applicable to: ALL

AIRPORT

Airport included in the flight plan:

- If the runway is not specified, the airport is indicated by a star and the identification is displayed in white
- If the runway is specified, it is indicated by an oriented runway symbol in white.



The runway is drawn to scale (paved length) if the selected range is 10, 20 or 40 NM.

Optional airport information

The airports that are not displayed as part of the flight plan may be displayed (ARPT pb on the EFIS control panel).
They are indicated by a star and the identification in magenta.

Ident.: DSC-31-45-B-00024249.0001001 / 28 MAY 20
Applicable to: ALL

ILS/LS COURSE

When the pilot pushes the ILS/LS pb on the EFIS control panel, and if an ILS/GLS ⊲ /FLS ⊲ /MLS ⊲ approach is selected, the display shows an ILS/LS course symbol:

	If an ILS/GLS ⊲ /MLS ⊲ or LOC approach is selected
	If an NPA approach with the FLS ⊲ for lateral guidance is selected.

Ident.: DSC-31-45-B-00024251.0001001 / 28 MAY 20
Applicable to: ALL

ILS/GLS ⊲ MARKER BEACONS

The screen indicates these as waypoints (diamonds).

When the aircraft overflies a marker beacon, the corresponding symbol flashes:

OM	The aircraft is over the outer marker
MM	The aircraft is over the middle marker
IM	The aircraft is over the inner marker.

CROSS TRACK ERROR

This is the lateral deviation of the aircraft from the active leg of the flight plan (related to the great circle route). It is indicated in nautical miles (NM), with the letter R (right) or L (left), according to the position of the aircraft compared to the flight plan.

Ident.: DSC-31-45-B-00024252.0001001 / 05 MAY 23
Applicable to: LV-KAN, LV-KAO

CROSS TRACK ERROR

This is the lateral deviation of the aircraft from the active leg of the flight plan (related to the great circle route). It is indicated in nautical miles (NM), with the letter R (right) or L (left), according to the position of the aircraft compared to the flight plan.

The following are the conditions of display:

- When the current RNP is equal or below 0.3 NM:
  1. The cross-track error is displayed with a precision of one digit (0.1 NM), when the cross-track error is strictly more than 0.29 NM
  2. The cross-track error is displayed with a precision of two digits (0.01 NM), from 0.02 NM to 0.29 NM
  3. When displayed, the cross-track error is removed when it is becomes less than 0.01 NM.
- When the current RNP is strictly above 0.3 NM:
  1. The cross-track error is displayed with a precision of one digit (0.1 NM)
  2. When displayed, the cross-track error is removed when it becomes less than 0.01 NM.

PLAN MODE

Ident.: DSC-31-45-00000744.0001001 / 03 JUN 20
Applicable to: ALL

This mode statically displays the flight plan legs on a map oriented to true north. The map is centered on a map reference point that the pilot selects by slewing to it on his MCDU.
The map reference point is the waypoint displayed on the second line of the MCDU F-PLN page. It can either be the active waypoint (next waypoint to be overflown), or any other waypoint of the flight plan.
The pilot can slew the overall flight plan and display it in PLAN mode.
The pilot chooses the scale of the map with the range selector. (The diameter of the outer circle corresponds to the selected range).
Data on navaids, and their characteristics and associated bearing pointers, are not available in this mode.

Each pilot may display the engine standby page on their respective ND via the ND selector on the EFIS control panel.
The displayed information is N1, N2, EGT, FF, FOB, slats/flaps position, alpha floor, idle message and limit modes (same presentation as the upper part of the primary engine page).
For more information on this page, refer to the POWERPLANT Chapter (*Refer to DSC-70-90-40 Engine/Warning Display*).

APPROACH MESSAGES

This message shows the full runway name of the selected approach.

Ident.: DSC-31-45-A-00024142.0001001 / 28 MAY 20

FEEDBACK MESSAGES

Refer to DSC-31-05-60 Messages on the Display Units (DUs) - Feedback Messages

Ident.: DSC-31-45-A-00024133.0001001 / 28 MAY 20

LOC OR F-LOC (FLS ◁)

If LOC or F-LOC (FLS ◁) data fails, this flag flashes for 9 s, then remains steady.
If there is an inconsistency in the approach mode selection within one MMR, both LOC and F-LOC (FLS ◁) flags flash for 9 s, then remain steady.

Ident.: DSC-31-45-A-00024132.0001001 / 28 MAY 20

CENTER PART MESSAGES

MODE CHANGE	Appears if there is a discrepancy between the selected mode on the EFIS control panel and the mode sent from the onside FMGEC, or while the DMC is preparing a new page for display.
RANGE CHANGE	Appears if there is a discrepancy between the range selected on the EFIS control panel and the range sent from the onside FMGEC. A MODE CHANGE message has priority over a RANGE CHANGE message.
MAP NOT AVAIL	Appears when one of the following occurs: • The MODE CHANGE or RANGE CHANGE message appears for more than 6 s, or • The FMGEC has failed, or • The FMGEC has delivered an invalid aircraft position.
W/S SET RNG 10 NM (PWS ◁)	Appears if a predictive windshear warning alert is triggered and the range is above 10 NM.
W/S SET RNG 10 NM (PWS ◁)	Appears if a predictive windshear caution alert is triggered and the range is above 10 NM.
W/S CHANGE MODE (PWS ◁)	Appears if a predictive windshear warning alert is triggered and the ND is not in ARC or ROSE mode.
W/S CHANGE MODE (PWS ◁)	Appears if a predictive windshear caution alert is triggered and the ND is not in ARC or ROSE mode.
TCAS Message	*Refer to DSC-34-20-60-20 Messages on ND*

Ident.: DSC-31-45-A-00024135.0001001 / 28 MAY 20

VOR

In ROSE VOR mode, when the VOR bearing is not valid, this flag flashes for 9 s, then remains steady.

Ident.: DSC-31-45-A-00024139.0001001 / 28 MAY 20

OFFSET MESSAGE

OFST R(L) XX	Appears when the flight crew prepares an offset or if an offset is selected. The offset value is provided in NM.

Ident.: DSC-31-45-A-00024136.0001001 / 28 MAY 20

NAVIGATION RECEIVERS

VOR 1	Appears if the VOR 1(2) fails. The associated flag flashes for 9 s, then remains steady.
ADF 1	Appears if the ADF 1(2) fails. The associated flag flashes for 9 s, then remains steady.
DME 1	Appears if the DME 1(2) fails. The associated flag flashes for 9 s, then remains steady.

Ident.: DSC-31-45-A-00024137.0001001 / 28 MAY 20

COURSE AND SLOPE INDICATION

CRSXXX	Appears if the VOR/ FLS /ILS course fails.
CRS---	Appears if there is non-computed data for the VOR/ FLS /ILS course.
XX	Appears if the FLS slope is invalid.
--	Appears if there is non-computed data for the FLS slope.

Ident.: DSC-31-45-A-00024131.0001001 / 28 MAY 20

DISCREPANCY MESSAGES

Refer to DSC-31-05-60 Messages on the Display Units (DUs) - Side1/Side2 Discrepancy Messages

Ident.: DSC-31-45-A-00024130.0001001 / 28 MAY 20

HDG

If the heading data fails, the ROSE, ARC and associated symbols disappear.
A HDG flag flashes for 9 s, then remains steady.

Ident.: DSC-31-45-A-00024134.0001001 / 28 MAY 20

G/S OR F-G/S (FLS)

If G/S or F-G/S (FLS) data fails, this flag flashes for 9 s, then remains steady.
If there is an inconsistency in the approach mode selection within one MMR, both G/S and F-G/S (FLS) flags flash for 9 s, then remain steady.

Ident.: DSC-31-45-A-00024140.0001001 / 28 MAY 20

PRED W/S (PWS)

Appears if the WINDSHEAR sw (PWS) on the weather radar panel is set to AUTO, and a PWS fault is detected. This message appears on ground, or when flaps and slats are extended.

It is associated with a single chime. The radar image remains available, provided that the fault does not affect the radar mode.

Ident.: DSC-31-45-A-00024138.0001001 / 04 NOV 20

OTHER MESSAGES

↓	Overflow arrow, displayed when more than one of the other messages are present at the same time.
BACK UP NAV ◁	Appears when the MCDU backup navigation mode is activated (*Refer to DSC-22_10-30 Back Up Navigation Mode*).
CHECK NORTH REF	Appears when the NORTH REF pb selection does not match the airport MAG/TRUE bearing reference (as stored in the FMGEC navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
CHK FLT PLN POSITION	Appears when the DMC detects a disagreement between the acquisition and the display of the flight plan when on ARC or ROSE NAV mode.
GPS PRIMARY ◁	Appears when GPS PRIMARY mode is available, or has been recovered. The flight crew can clear this message by pressing the CLR key on the MCDU.
GPS PRIMARY LOST ◁	Appears when GPS PRIMARY is not available, and not clearable by flight crew action.
MAP PARTLY DISPLAYED	Appears when there is an incomplete data transmission between the FMGEC and the DMC, or if the DMC cannot draw the complete MAP.
NAV ACCUR UPGRAD or NAV ACCUR DOWNGRAD	Appears when there is a change in navigation accuracy.
OFF SIDE FM CONTROL	Appears when the offside FMGEC supplies the onside ND.
RTA MISSED ◁	Appears when a time constraint is defined in the active flight plan and this time constraint is predicted as "missed" by the FMGEC.
SELECT TRUE REF	Appears when entering the polar area, if the TRUE North reference is not selected by the flight crew (MAG/TRUE pb).

SPECIFIC VOR/D UNAVAIL	Appears when the NAVAID, that is tuned for the selected approach or departure, is not available.
TCAS Operating Messages	*Refer to DSC-34-20-60-20 Messages on ND*

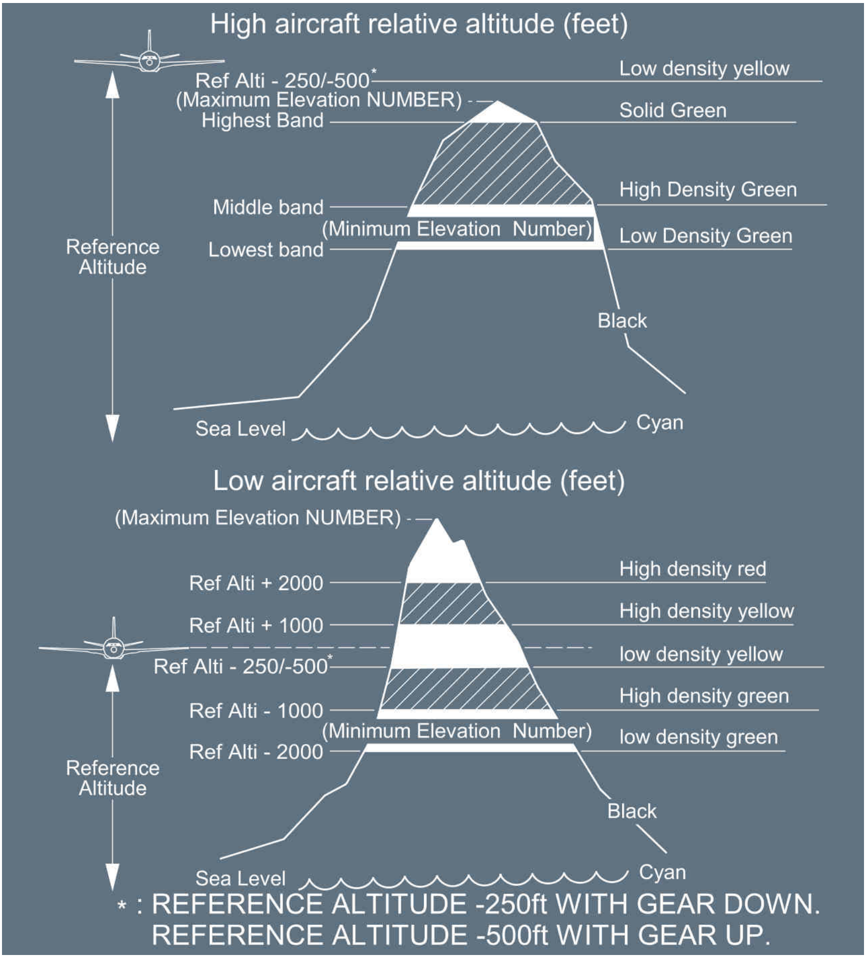
(1) EGPWS terrain picture

The ND displays the EGPWS terrain picture, when the TERR ON ND switch is selected ON, and the ND is not in PLAN or ENG mode. The terrain picture replaces the weather radar image. Terrain data is displayed independently of the aircraft relative altitude. The terrain appears in different colors and densities, according to its relative height:



High aircraft relative altitude (feet)
Ref Alti - 250/-500*
(Maximum Elevation NUMBER)
Highest Band
Middle band
(Minimum Elevation Number)
Lowest band
Reference Altitude
Low density yellow
Solid Green
High Density Green
Low Density Green
Black
Sea Level
Cyan
Low aircraft relative altitude (feet)
(Maximum Elevation NUMBER)
Ref Alti + 2000
Ref Alti + 1000
Ref Alti - 250/-500*
Ref Alti - 1000
(Minimum Elevation Number)
Ref Alti - 2000
Reference Altitude
High density red
High density yellow
low density yellow
High density green
low density green
Black
Sea Level
Cyan
* : REFERENCE ALTITUDE -250ft WITH GEAR DOWN.
REFERENCE ALTITUDE -500ft WITH GEAR UP.

Note:
- *Areas without available terrain data in the EGPWS database appear in magenta.*
- *The reference altitude is computed based on the current aircraft altitude or, if descending more than 1 000 ft/min, the altitude expected in 30 s.*
- *In case of flight above the maximum elevation number the relief between the minimum and maximum displayed elevations is displayed by using three different green levels.*

(2) Center Part Messages

- The “TERR CHANGE MODE” indication is displayed in red (or amber), in the case of a Terrain Awareness Display (TAD) warning (or caution) alert, if the current selected display mode is PLAN.
- The “TERR REDUCE RANGE” indication is displayed in red (or amber), in the case of a Terrain Awareness Display (TAD) warning (or caution) alert, if the selected range is 160 NM or 320 NM.

(3) TERR indication

To differentiate between the terrain and the weather display, the weather radar TILT is replaced by a blue TERR, and the terrain display sweeps from the center outward to both ND sides.

(4) Warning and caution messages

TERR AHEAD/OBST AHEAD (amber) : For a caution

TERR AHEAD/OBST AHEAD (red) : For a warning.

When triggered, these messages flash for 9 s, then remain steady until the caution or warning alert condition disappears.

TERR RNG (red) : For a RANGE error warning.

TERR TST (amber) : Appears during the EGPWS test, when the terrain pattern is displayed, and there is no failure.

(5) Terrain or obstacle caution alert

Generated when a conflict exists between the terrain caution envelope, ahead of the aircraft, and the terrain/obstacles data stored in the database. The conflict area is shown in solid yellow.

(6) Terrain or obstacle warning alert

Generated when a conflict exists between the terrain warning envelope, ahead of the aircraft, and the terrain/obstacles data stored in the database. The conflict area is shown in solid red.

Note: *When an alert is generated (either caution or warning), and TERR ON ND is not selected, the terrain/obstacles is automatically displayed and the TERR ON ND pushbutton ON light comes on.*

(7) Lowest and highest elevations

Minimum and maximum elevations encountered ahead of the aircraft, within the selected ND range. The color code of the elevation figures is the same as for the EGPWS terrain picture.

Note: *When an alert is generated (either caution or warning), and TERR ON ND is not selected, the terrain/obstacles is automatically displayed and the TERR ON ND pushbutton ON light comes on.*

(7) Lowest and highest elevations

Minimum and maximum elevations encountered ahead of the aircraft, within the selected ND range. The color code of the elevation figures is the same as for the EGPWS terrain picture.

Note: *The elevations shown on the ND correspond to the terrain included in the selected ND range, ahead of the aircraft. In ARC mode, the elevations are linked with the terrain displayed on the ND. In ROSE mode, the elevations may not represent the lowest and highest terrain currently displayed on the ND.*

Intentionally left blank

EFIS CONTROL PANEL WITH OANS ⩤ ZOOM FUNCTION

Ident.: DSC-31-50-00018571.0001001 / 21 MAR 16
Applicable to: ALL

The On-board Airport Navigation System (OANS) is an optional function that provides the flight crew with a moving airport map on the ND. The OANS is designed to improve the flight crew awareness of airport surfaces. Refer to DSC-34-35 Airport Navigation.
The OANS requires a dedicated EFIS control panel with a ZOOM notch on the range knob-selector. If OANS is not installed or is deactivated, a DEACT placard is present below the ZOOM notch on the EFIS control panel.
The flight crew can turn the knob-selector to the ZOOM notch, however the map displayed on the ND will remain at 10 NM range and a led will turn on to indicate that the knob-selector is in ZOOM (DEACT) position. Turn back the knob-selector as necessary to select the required range.

(1) OFF/BRT knobs

- These knobs turn the PFD and ND display units on and off, and control their brightness.
- The display brightness automatically adjusts for changing light conditions. It may also be adjusted manually.

PFD Brightness Control Knob

Rotating this knob all the way counterclockwise switches off the PFD. In this case, the PFD image is automatically displayed on the NDU, but the pilot may recover the ND by means of the PFD-ND XFR pushbutton.

ND Brightness Control Knob

The outer knob controls only the brightness of both the weather radar image and the EGPWS terrain display.

The inner knob controls the general brightness of the ND symbols.

Rotating this knob all the way counterclockwise switches off the NDU.

(2) PFD/ND Pushbutton

Pushing this button interchanges the PFD and the ND.

If the PFDU fails, the PFD transfers automatically to the NDU.

(3) EFIS DMC sel

NORM: The DMC 1 supplies CAPT EFIS DUs and DMC 2 supplies F/O EFIS DUs.

3 : The onside DMC is replaced by DMC3.

2 or 1 : The onside DMC is replaced by DMC 2 or 1.

Some switching configurations generate FMA message (*Refer to DSC-22_30-80-20 EFIS SINGLE SOURCE 1(2)*, *Refer to DSC-22_30-80-20 EFIS SWTG NOT ALLOWED*).

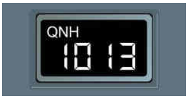
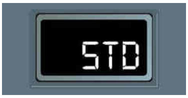
BAROMETER REFERENCE WINDOW

L12



The barometric reference is set to QNH and the QNH value is 1 013 hPa. The minimum QNH value that can be selected is 745 hPa (22.00 inHg) and the maximum is 1 100 hPa (32.48 inHg).

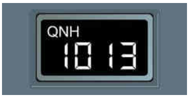


The barometric reference is set to STD.

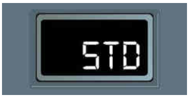
Ident.: DSC-31-50-A-00024285.0001001 / 04 NOV 21
Applicable to: LV-GKO, LV-GKP

BAROMETER REFERENCE WINDOW

L12



The barometric reference is set to QNH and the QNH value is 1 013 hPa. The minimum QNH value that can be selected is 745 hPa (22.00 inHg) and the maximum is 1 050 hPa (31.00 inHg).

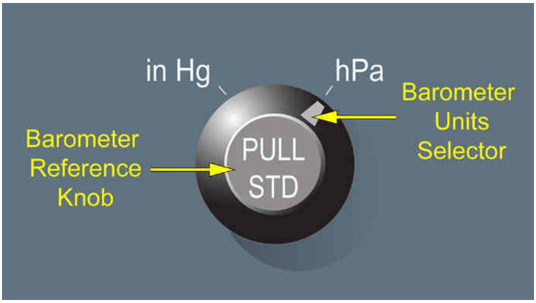


The barometric reference is set to STD.

Ident.: DSC-31-50-A-00024287.0001001 / 02 JUN 20
Applicable to: ALL

BAROMETER REFERENCE SELECTOR SCHEMATIC

The barometric reference controls have an outer selector, and an inner knob.



The flight crew uses the barometric reference selector to select the barometric unit hectoPascals (hPa) or inches of mercury (inHg).

L2 *Note: The PFDs do not display the selected barometric unit.*

Ident.: DSC-31-50-A-00024288.0001001 / 04 NOV 21
Applicable to: ALL

BAROMETER REFERENCE SELECTOR

The flight crew turns the barometric reference knob to select the QNH value.
The flight crew pulls or pushes the barometric reference knob to select the barometric reference (QNH or STD).
When the flight crew pulls the barometric reference knob, the barometric reference value is set to STD.

When the flight crew pushes the barometric reference knob, the barometric reference is set to QNH.

L2 The selected QNH value appears in the barometric reference window, and under the altitude scale on the PFD.

L1 At the EFIS CP power-up, the barometric reference is QNH and the QNH value is set to 1 013 hPa or 29.92 inHg, depending on the selected barometric unit.

Ident.: DSC-31-50-A-00024289.0001001 / 02 JUN 20
Applicable to: ALL

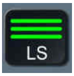
FD PB

The CAPT(F/O) PFD displays the FD bars (or the FPD symbol if the TRK FPA reference is selected).

The CAPT(F/O) PFD does not display the FD bars (or the FPD symbol if the TRK FPA reference is selected).

Ident.: DSC-31-50-A-00024290.0001001 / 15 NOV 21
Applicable to: ALL

LS PB



The CAPT(F/O) PFD displays the following landing system data in accordance with the approach selected on the ARRIVAL page (ILS / GLS ◁ / FLS ◁ / SLS ◁):
Deviation scales, deviation signals, course pointer, information.
For more information about the landing system data (*Refer to DSC-31-40 Trajectory Deviation - ILS Approach*).
If the flight crew selected an approach compatible with the FLS ◁ , the FMA displays the FLS ◁ capability, if the flight phase is descent or approach.
The FLS ◁ capability does not appear, if the NO FLS FOR THIS APPR message appeared on the MCDU.

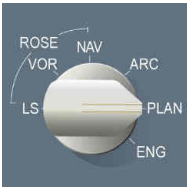
Note: *If the direct distance to the destination airport is more than 300 NM only the deviation scales appear.*

The CAPT(F/O) PFD does not display the landing system data.

Ident.: DSC-31-50-A-00024291.0001001 / 03 JUN 20
Applicable to: ALL

MODE SELECT SWITCH

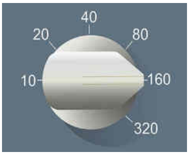
L12



For navigation purposes, the flight crew can select one of the following display modes:
- PLAN mode (*Refer to DSC-31-45 Plan Mode*
  If the flight crew selects the PLAN mode, the ND does not display terrain, weather, or traffic information.
- ARC mode (*Refer to DSC-31-45 ROSE NAV Mode/ARC Mode*)
- ROSE-NAV mode (*Refer to DSC-31-45 ROSE NAV Mode/ARC Mode*)
- ROSE-VOR mode (*Refer to DSC-31-45 Rose VOR Mode*)
- ROSE-LS mode (*Refer to DSC-31-45 Rose LS Mode*)
- ENG mode (*Refer to DSC-31-45 Engine Standby Page*)

Ident.: DSC-31-50-A-00024292.0001001 / 02 JUN 20
Applicable to: ALL

RANGE SELECT SWITCH

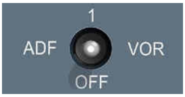


The range selector enables the flight crew to select the range of the ND.

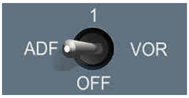
Note: *If the mode or the range data fails, the default selection is the ROSE NAV mode and 80 NM range.*

Ident.: DSC-31-50-A-00024294.0001001 / 02 JUN 20
Applicable to: ALL

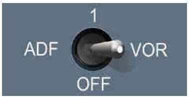
ADF1(2) ◁ - VOR1(2) SELECT SWITCHES



The ND does not display the ADF1(2) ◁ or VOR1(2) bearing pointers and DME distance.



Enables the flight crew to select ADF1(2) ◁ on the onside ND, as well as the corresponding navaid data characteristics in any mode except PLAN mode.

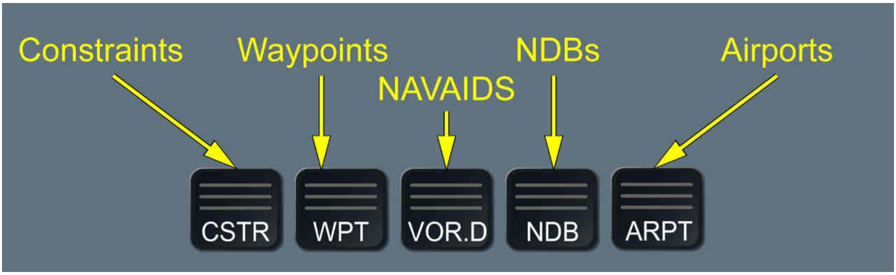


Enables the flight crew to select VOR1(2) bearing pointers and DME distance on the onside ND, as well as the corresponding navaid data characteristics in any mode except PLAN mode.

Ident.: DSC-31-50-A-00024295.0001001 / 02 JUN 20
Applicable to: ALL

OPTIONAL DATA DISPLAY PUSHBUTTON SCHEMATICS

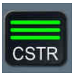
The flight crew can use the following pushbuttons to display the associated optional data in addition to the data permanently displayed in PLAN, ARC, or ROSE NAV modes. Only one option can be activated at a time.



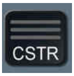
Ident.: DSC-31-50-A-00024296.0001001 / 02 JUN 20
Applicable to: ALL

OPTIONAL DATA DISPLAY PUSHBUTTON

CONSTRAINTS

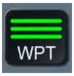


The ND displays constraints related to the waypoints.

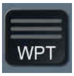


The ND does not display constraints.

WAYPOINTS



The ND displays the waypoints stored in the navigation database and the pilot stored navaids.
The flight crew can only select one display at a time (WPT, VOR-D, or NBD (ADF1(2) ◁✳).



The ND does not display waypoints.

NAVAIDS

The ND displays the VORs and DMEs stored in the navigation database and the pilot stored navaids.
The flight crew can only select one display at a time (WPT, VOR-D, or NBD (ADF1(2) ◁).

The ND does not display VORs and DMEs.

NDBS

The ND displays the NDBs stored in the navigation database.
The flight crew can only select one display at a time (WPT, VOR-D, or NBD (ADF1(2) ◁).

The ND does not display NDBs.

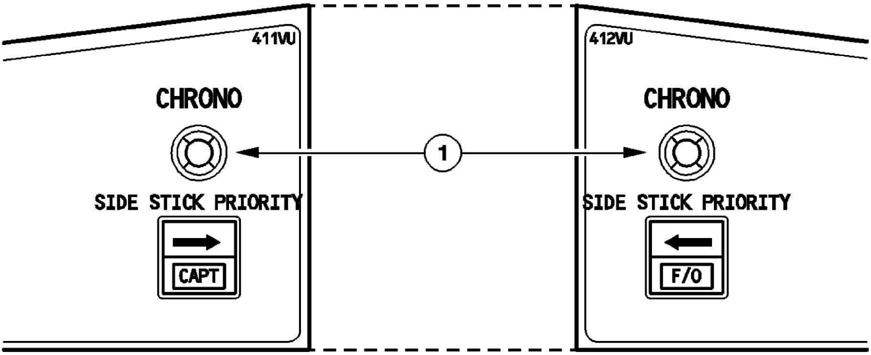
AIRPORTS

The ND displays the airports stored in the navigation database, other than the origin or destination airports.

The ND does not display airports.

CHRONOMETER (GLARESHIELD)

Ident.: DSC-31-50-00000762.0001001 / 27 JAN 11
Applicable to: ALL



(1) CHRONO Pushbutton
Pushing this button displays chronometer time on the onside ND.
Pushing it again freezes the displayed value.
Pushing it a third time resets the chronometer, and the chronometer time disappears from the display.

MEMO DISPLAY

Ident.: DSC-31-50-00017075.0001001 / 21 MAR 16
Applicable to: ALL

EFIS SWTG : This memo appears in green, when either the CAPT EFIS DMC selector or the F/O EFIS DMC selector is not in the NORM position.

GENERAL

Ident.: DSC-31-55-10-00000763.0007001 / 14 FEB 11
Applicable to: ALL

A fully independent clock is on the right side of the control panel.
It sends time to the Central Maintenance Computer, the Flight Data Interface Unit, and the Flight Management and Guidance Computer.
The clock has two electrical supplies, one of which is a direct connection to the aircraft's battery hot bus.

The clock performs four functions:
- It displays “UTC” (GMT) time in hours, minutes, and seconds, on the center counter.
- It displays elapsed time (ET) (from engine startup) in hours, and minutes, on the lower counter.
- It drives the chronometer (CHR), which measures a time interval (from the pushing of the CHRONO button) in minutes and seconds, and displays it with a needle and in numbers on the upper counter.
- It can replace the UTC with the date.

Intentionally left blank

(1) UTC (GMT) counter
This counter displays the present time in 24 h format from 0 to 23 h 59 min 59 s.

(2) Elapsed Time (ET) counter
This counter registers the aircraft's flight time from 0 to 99 h and 59 min.

(3) Chrono (CHR) counter
This counter registers elapsed time from 0 to 99 min 59 s. It is controlled by the CHR pushbutton.

(4) CHR pushbutton

First push : Starts the CHR counter

Second push: Stops the CHR counter, and keeps the display at its last indication.

(5) Reset (RST) pushbutton
When pressed, the CHR counter restarts from 0, if the chrono is running.

(6) ET selector

"RUN"	:	The ET counter starts
"STP"	:	The ET counter stops counting
Spring-loaded "RST"	:	The ET counter goes blank. The selector returns to its STP position when the selector is released.

Note: A cumulative elapsed time can be achieved by alternatively setting this switch to the "RUN" and "STP" position.

(7) DATE/SET button

First push	:	Sets the clock to date mode. The UTC time display is replaced by the date (day/month/year).
Second push	:	Sets the clock to time mode. The date display disappears.

Note: In order to select the date mode, switch the UTC selector to "GPS" or "INT" .

(8) UTC selector

GPS : The time (or date, if selected) is displayed, and this data is synchronized with GPS information.

Note:
- *If the signal between the GPS and the clock is not detected, or if the signal is detected, but the GPS data is invalid, the clock automatically runs on its internal time.*
- *The clock will automatically resynchronize with the GPS information, as soon as the GPS data is available.*

INT : The internal time (or date, if selected) is displayed.

Note:
- *The clock's internal time is always synchronized with the latest valid GPS information unless the pilot enters a different internal time, via the SET function.*
- *If there is no valid GPS information at power up, the internal time will be 00: 00: 00, until the clock is initialized, or until valid GPS information is available.*

SET : Allows the internal time and date to be initialized.

OPERATION IN INTERNAL MODE

Ident.: DSC-31-55-20-00005549.0001001 / 20 SEP 16
Applicable to: ALL

DATE INITIALIZATION

Set the UTC selector to SET. The minute digits flash, and the seconds' digits are blank.
To increase data, turn the DATE/SET pushbutton clockwise.
To decrease data, turn the DATE/SET pushbutton counterclockwise.

- First, press on DATE/SET: To set the hour.
- Second, press on DATE/SET: To set the year.
- Third, press on DATE/SET: To set the month.
- Fourth, press on DATE/SET: To set the day.

Switch the UTC selector to INT, position and the clock will start with the seconds' digits at 00.

Note: *This process must be completed in less than one minute. Otherwise, it will be necessary to reset the CMC, in order to synchronize the lower ECAM time display with the cockpit clock display. Resetting the CMC is a maintenance operation.*

PRECAUTION IN CASE OF ATC DATALINK COMMUNICATION

If the clock is set to internal (INT) mode and the flight crew manually sets the time and date, the clock does not comply with the time precision required for ATC datalink communication (+/- 1 s UTC). This may lead to the rejection of messages, or to the acceptance of obsolete messages:

- The CPDLC function will send CPDLC messages with an erroneous date/time
- The CPDLC function will accept obsolete uplink messages and may reject uplink messages with a correct date/time
- The uplink messages for oceanic and departure clearance will be displayed in the Datalink Control and Display Unit (DCDU) with an erroneous time
- The ADS-C function will continue to operate, but in a degraded mode.

To comply with the time precision requirement for ATC datalink communication, the flight crew must either:

- Use the clock in GPS mode, or
- Use the clock in INT mode and synchronize the clock with the GPS at least one time per day. This synchronization ensures that the UTC time drift is below +/- 1 s UTC.

GPS SYNCHRONIZATION IN INTERNAL MODE

When the clock is set to INT mode, the UTC time is only based on the internal clock and is not synchonized with the GPS. To reset the drift that results from the UTC internal time, the flight crew must perform the following actions:

- Set the UTC selector of the clock to the GPS mode and keep this setting during at least 10 seconds
- Then reset the UTC selector of the clock to INT mode.

These actions result in a resynchronization of the internal clock with the GPS.

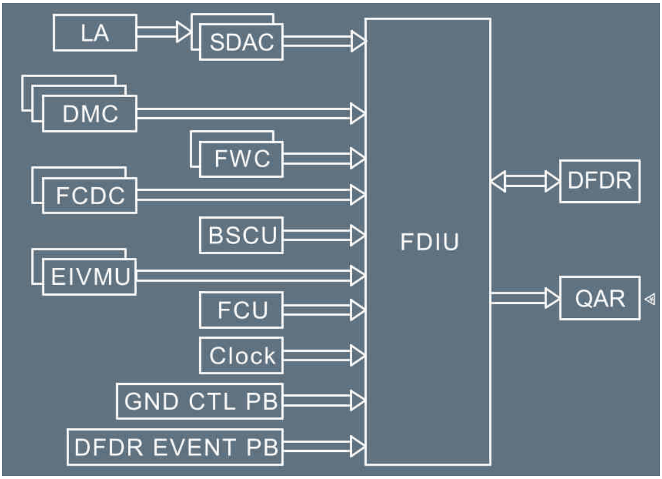
Intentionally left blank

DESCRIPTION

Ident.: DSC-31-60-10-00017892.0003001 / 21 MAR 16
Applicable to: LV-GKO, LV-GKP

The Flight Data Recording System, which records the mandatory parameters, consists of the following components:
- A Flight Data Interface Unit (FDIU)
- A Digital Flight Data Recorder (DFDR)
- A three-axis Linear Accelerometer (LA)

The FDIU collects and processes parameters from the SDACs, DMCs, FWCs, FCDCs, BSCU, EIVMUs, FCU, the DFDR event pushbutton, the GND CTL pushbutton and the Clock.
It stores the mandatory flight parameters in the DFDR.
The DFDR can store the last 25 h data, at least. It stores this data on a fireproof and shockproof device. An underwater locator beacon is attached to the DFDR.
The linear accelerometer measures the acceleration of the aircraft along each of the three axes.
The QAR ◁ is a recorder that stores the same data as the DFDR. However, the QAR ◁ is more accessible for the maintenance crew.



The recording system is automatically active:
- On ground, during the first 5 min after the aircraft electric network is energized.
- On ground, after the first engine start.
- In flight (whether the engines are running or not).

On the ground, the recording system automatically stops 5 min after the second engine shuts down.

On the ground, the crew can manually start the recording system by pressing the GND CTL pushbutton.

DESCRIPTION

The ACMS is used to monitor various aircraft system parameters in order to make maintenance easier and to allow formulating operational recommendations.
The ACMS can generate system reports. The Airbus Standard Reports are preprogrammed reports available at aircraft delivery. The operator can create its own reports.
The ACMS uses the Flight Data Interface and Management Unit (FDIMU) to acquire the relevant aircraft system parameters. The FDIMU is connected to the rest of the ACMS as shown below.
The system may be programmed using the MCDUs. The crew can select any report to be displayed on the MCDUs.
The Printer prints the flight phase programmed reports or any report selected on the MCDU.
This printing may be automatic or in response to the ACMS PRINT pushbutton.
The ACMS may send automatic reports via ACARS ◁* .
An optional Digital Recorder may be installed to extend the recording capacity.

GENERAL

Ident.: DSC-32-10-10-00018883.0001001 / 21 MAR 16
Applicable to: ALL

The landing gear consists of :
- Two inboard retracting main gears
- One forward retracting nose gear
- One forward retracting center gear (for A340 only).

Gear doors enclose the landing gear bays. Gears and doors are electrically-controlled and hydraulically-operated.
The doors which are fitted to the landing struts are mechanically-operated by the gear, and close at the end of gear retraction.
All gear doors open during landing gear transit. The hydraulically operated doors close at the end of each retraction and extension sequence.
Gears and doors' actuation are electrically-signalled by two Landing Gear Control and Interface Units (LGCIUs).
The LGCIUs process gears and doors positions, sequencing control and gear lever selection. They also provide landing gear information on the ECAM, and ground/flight signals for other aircraft systems.

MAIN LANDING GEAR (MLG)

Ident.: DSC-32-10-10-00018884.0004001 / 21 MAR 16
Applicable to: ALL

Each main gear is a four wheel, twin tandem bogie assembly having an oleopneumatic shock absorber.
Each main wheel is fitted with an antiskid brake.
A shortening mechanism, attached to the wing, reduces main gear length by retracting the shock absorber into the main leg during retraction.
An hydraulically-operated pitch trimmer on each bogie beam damps the movement and ensures return to normal position after liftoff.

NOSE LANDING GEAR (NLG)

Ident.: DSC-32-10-10-00018886.0001001 / 21 MAR 16
Applicable to: ALL

The two-wheel nose gear comprises an oleopneumatic shock strut and a nosewheel steering system.
It retracts forward into the fuselage.

Applicable to: ALL

NORMAL OPERATION

Landing gear normal operation is controlled by the lever located on the center instrument panel.
Gear and door sequencing is electrically-controlled by the LGCIUs. Each LGCIU controls one complete gear cycle and switches over automatically at each landing gear retraction cycle or in case of failure.
All gears and doors are hydraulically-actuated by the green hydraulic system. Hydraulic supply is automatically isolated by closing a safety valve above 280 kt. It is maintained closed until the landing gear lever is moved to the DOWN position and the aircraft speed decreases below 280 kt.
For A340-200/300 aircraft, the center landing gear may be inhibited by ground maintenance action. Therefore, it will be mechanically-fixed in the uplock position while doors will continue to operate during the landing gear retract/extend sequence.

LANDING GEAR GRAVITY EXTENSION

The gravity extension system is an electro-mechanical system, controlled through two selectors located on the center instrument panel. It permits main and nose landing gear extension in case the normal system fails.

When the related electrical selectors are set to down, the :
- Landing gear hydraulic system is isolated from the green hydraulic system
- Main and nose landing gear doors, and gears unlock
- Main and nose landing gears extend by gravity
- Locking springs assist the downlocking
- Main and nose landing gear doors remain open.

After a free fall extension, it is possible to restore normal operation, provided green hydraulic pressure is available.
The cockpit indications are the same as those for normal extension and retraction.

Note: *In case of landing gear gravity extension, the nose wheel steering is lost.*

LANDING GEAR CONTROL INTERFACE UNIT (LGCIU)

Ident.: DSC-32-10-20-00018894.0001001 / 21 MAR 16
Applicable to: ALL

Two LGCIUs receive landing gear position information from the proximity sensors when:

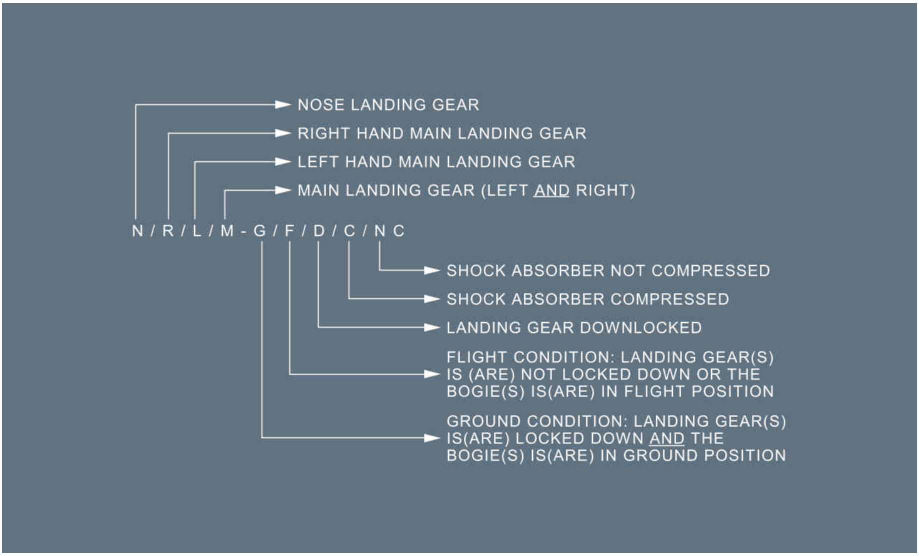
- The landing gears are locked down or up, or
- The shock absorbers are compressed or extended, or
- The landing gear doors are open, or closed.

The LGCIUs send the landing gear position data to other aircraft systems.
In case of a LGCIU failure, the landing gear is controlled by the remaining healthy LGCIU.

LANDING GEAR - AIRCRAFT SYSTEM INTERFACE

Ident.: DSC-32-10-20-00018895.0001001 / 02 JUN 20
Applicable to: ALL

The two LGCIUs provide following discrete logic signals to various aircraft systems.



NOSE LANDING GEAR
RIGHT HAND MAIN LANDING GEAR
LEFT HAND MAIN LANDING GEAR
MAIN LANDING GEAR (LEFT AND RIGHT)

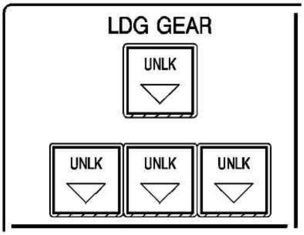
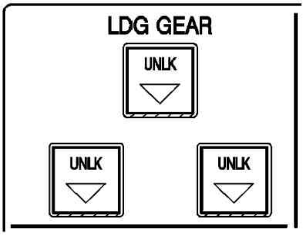
LANDING GEAR INDICATOR PANEL

Ident.: DSC-32-10-30-00018897.0002001 / 21 MAR 16
Applicable to: ALL

A340 Landing Gear Indicator Panel



A330 Landing Gear Indicator Panel



Connected to LGCIU 1 which receives signals from proximity sensors.

No light : Indicate landing gear is retracted and locked up with landing gear lever selected up.

▿ light : Illuminate green if the landing gear is locked down.

UNLK light : Illuminate red if the landing gear is not locked in selected position.

Note: *The green▿ lights on the LANDING GEAR indicator panel come on as long as the LGCIU 1 is electrically supplied. For A340 aircraft, the center landing gear may not light up, depending on the LGCIU failure.*

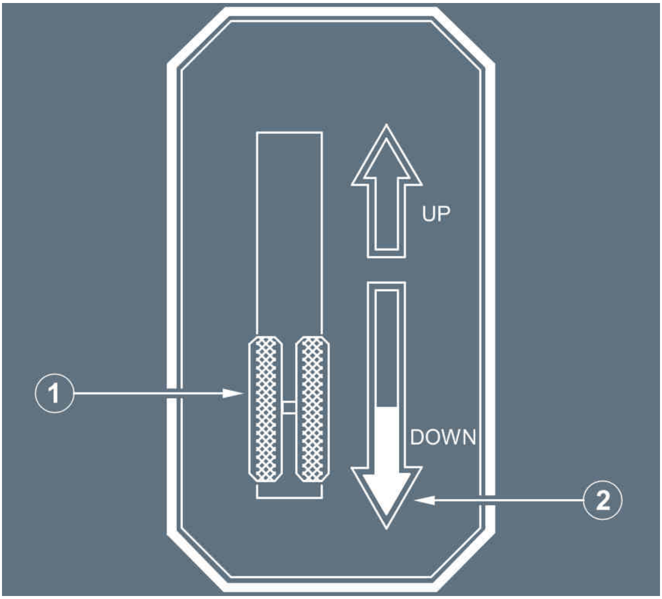
Note: *If one UNLK indication remains on at gear extension, the landing gear position can be confirmed using the WHEEL SD page (information from LGCIU 1 & 2) : only one green triangle on each landing gear is sufficient to confirm that the landing gear is downlocked.*

LANDING GEAR SELECTOR LEVER

Ident.: DSC-32-10-30-00018898.0001001 / 20 MAY 16
Applicable to: ALL

A two-position selector lever provides electrical signals to the two LGCIUs, which control green hydraulic supply by means of selector valves.
The flight crew must always move the L/G lever in one continuous movement (i.e. with no stop between both positions).

Upon selection of UP or DOWN, and provided the airspeed is below 280 kt :
- All landing gear doors open
- Landing gears move to the new selected position
- All doors close.



(1) L/G LEVER

UP : Landing gear retraction is selected.
During gear door opening, main and center (for A340-500/600 only) landing gear wheels are automatically braked by the normal braking system.
The nose gear wheels are braked by a brake band in the gear bay.

DOWN : Landing gear extension is selected.

An interlock mechanism prevents unsafe retraction by locking the lever in the DOWN position, when either :
- Both main landing gear bogies are compressed (aircraft on ground), or
- On A340 aircraft, the center landing gear shock absorber is not fully extended (aircraft on ground), or
- The nose landing gear shock absorber is not fully extended (aircraft on ground), and the nose wheels are not in the center position.

When the landing gear is extended, the system remains pressurized (if green hydraulic pressure is available).

(2) RED ARROW
The red arrow, and associated ECAM warnings come on red in approach at 750 ft RA, if the landing gear is not downlocked in landing configuration.*Refer to PRO-ABN-LG L/G GEAR NOT DOWN*

(IN CLOSED
POSITION)

The landing gear gravity extension selectors are locked-toggle type selectors. The selectors are connected by a link, so that both are operated simultaneously.

When the link is disconnected, each selector can be independently operated.

(1) LDG GEAR GRVTY EXTN selector
Each selector has three positions :

OFF :	Normal position. Landing gear operation is controlled by the LGCIU and the landing gear lever.
DOWN : (guarded)	The two motorized actuators are electrically-powered to close the hydraulic cut-off valve and to disengage door and gear uplocks which permit the nose, center (for A340-500/600 only), and main landing gear to deploy by gravity and to automatically lock down.
RESET :	The actuators return to the initial position, and automatically set the system back to the normal extension and retraction mode. The selectors are then set to off for normal operation.

Note: To select the landing gear, both selector guards have to be open.

WHEEL SD PAGE

Ident.: DSC-32-10-30-00018900.0001001 / 08 NOV 22
Applicable to: ALL

The WHEEL SD page is automatically displayed:
- On ground, before takeoff with engine running (flight phase 2). It disappears at engine T.O power application.
- In approach, at landing gear down selection or below 800 ft radio height (flight phases 7, 8, 9). It disappears at engine shutdown.

L/G CTL INDICATION

L/G CTL

The associated landing gear position disagrees with the lever position following a 30 s time delay.
The associated ECAM alert is triggered.

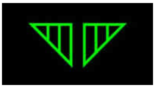
UPLOCK INDICATION

UP LOCK

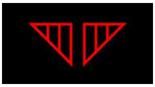
The associated landing gear is locked down, and one or more uplocks are in the closed position.
Associated with the following L/G GEAR UPLOCK FAULT alert (*Refer to PRO-ABN-LG L/G GEAR UPLOCK FAULT*).

LANDING GEAR INDICATION

The landing gear is indicated by two triangles for each gear.
The left triangle is controlled by LGCIU 1, the right one by LGCIU 2.

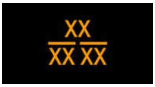


The LGCIU detects the associated landing gear as locked down.



The LGCIU detects the associated landing gear as in transit.

The LGCIU detects the associated landing gear as retracted and uplocked.

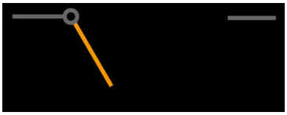


The LGCIU is failed.

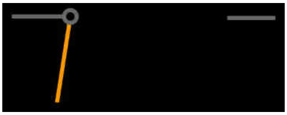
Note: *When the landing gear lever is down, one LGCIU locked down indication (one green triangle per gear) is sufficient to indicate that the landing gear is down and locked.*

LANDING GEAR DOOR INDICATION

The associated landing gear door is closed and uplocked.



The associated landing gear door is in transit.



The associated landing gear door is open.

DESCRIPTION

Ident.: DSC-32-20-10-00000618.0006001 / 09 OCT 12

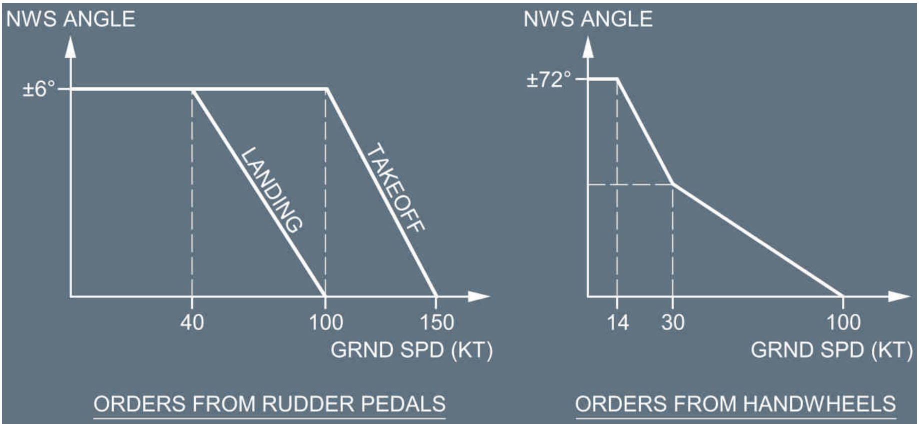
1 **Applicable to: LV-KAN**

Nose wheel steering is provided by two actuators, powered by the green hydraulic system and electrically-signalled by the Brake and Steering Control Unit (BSCU).

The BSCU has two independent systems. Only one is active at a time, while the other is on standby.

To control the steering the BSCU receives inputs from the steering hand wheels, the rudder pedals, and the Auto Pilot.

The BSCU transforms the pilot order into a nose wheels steering angle by controlling the servo-valve to provide the requested flow for the hydraulic actuators. The following limitations apply:



The steering handwheels control the nosewheel steering angle up to ±72 ° in either direction.

A lever on the towing electrical box (on the nose L/G) enables the steering system to be deactivated for towing purposes.

A visual red warning on the overhead panel indicates to the crew that an oversteer (±93 °) has occurred.

Pilots can disconnect the rudder pedal order to the BSCU, through a pushbutton located on each steering hand wheel.

An internal cam mechanism returns the nose wheel to the centered position after takeoff.

RUDDER PEDALS

Ident.: DSC-32-20-20-00018905.0001001 / 21 MAR 16
Applicable to: ALL

Nosewheel steering control authority depends on aircraft speed. Rudder pedals provide nosewheel steering control when:
- The speed is below 100 kt at landing, or
- Up to 150 kt for takeoff.

Note: The nosewheel steering angle depends on aircraft speed, and will return to zero if the aircraft is above these speeds.

SIDE CONSOLES

GENERAL

Ident.: DSC-32-30-10-00018913.0001001 / 21 MAR 16
Applicable to: ALL

The main wheels are equipped with carbon multidisc brakes, which can be actuated by either of two independent brake systems.
The normal system uses green hydraulic pressure, whilst the alternate system uses the blue hydraulic system (backed up by the hydraulic accumulator).
An antiskid and autobrake system is also provided.

SPEED
SENSOR UNIT

Braking commands come from either the brake pedals (pilot action), or the autobrake system (deceleration rate selected by the crew).

A dual channel Brake and Steering Control Unit (BSCU) controls all braking modes and functions which are the following :

- Normal braking
- Alternate braking
- Autobrake
- Antiskid.

The BSCU performs the following secondary functions:
- Checks the residual pressure in the brakes
- Monitors brake temperature
- Provides discrete wheel speed information to other aircraft systems.

A changeover between the two BSCU systems takes place at each DOWN landing lever selection, or in case one system fails.
The main gear wheels are fitted with fusible plugs which protect against tire burst in the event of overheat.
Main gear wheels are also equipped with brake cooling fans ◁ , which permit a high speed cooling of the brakes.

ANTISKID SYSTEM

Ident.: DSC-32-30-10-00018914.0001001 / 21 MAR 16
Applicable to: ALL

The antiskid system provides maximum braking efficiency by maintaining the wheels at the limit of an impending skid.
At skid start, brake release orders are sent to:

- Normal servovalves
- Alternate servovalves
- ECAM system which displays the released brakes.

Without using autobrake, full braking performance is achieved only with brake pedals at full deflection.
The antiskid system is deactivated below 10 kt (ground speed). For A340-500/600, below 10 kt (ground speed), the antiskid system is only operative during hard braking.
An ON/OFF switch activates or deactivates the antiskid system.

A/SKID PRINCIPLE

The A/SKID system compares the speed of each MLG wheel (and NLG wheel for A340-500/600) given by a tachometer with the aircraft speed called reference speed.
When the speed of a wheel decreases below 0.88 time the reference speed, brake release orders are given to maintain the wheel speed at the value (best braking efficiency).

In normal operation, the reference speed is determined by BSCU from the horizontal acceleration from ADIRU1 or ADIRU2 or ADIRU3.
In case all ADIRUs are failed, reference speed equals the maximum of either landing gear wheel speeds.

AUTOBRAKE

Ident.: DSC-32-30-10-A-00018916.0001001 / 21 MAR 16
Applicable to: ALL

The A/BRK is a function that automatically decelerates the aircraft during landing, or in the case of a rejected takeoff (RTO). The A/BRK:

- Avoids any delay for brake application in the case of an RTO
- Reduces flight crew workload during landing, by maintaining a constant deceleration rate
- Reduces the number of brake applications, and therefore, brake wear.

Ident.: DSC-32-30-10-A-00018918.0006001 / 21 MAR 17
Applicable to: LV-GIF

SYSTEM ARMING

The crew may arm the system by pressing the LO, MED, or MAX pushbutton provided all the following arming conditions are met :
- Green pressure available
- Antiskid electrically-powered
- No failure in the braking system
- At least two PRIMs are available and able to command the ground spoilers extension
- At least one ADIRU available.

Note: *Autobrake may be armed with the parking brake on.*

The armed AUTO BRK mode is displayed in blue on the Flight Mode Annunciator (FMA).

Ident.: DSC-32-30-10-A-00018918.0007001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GKO, LV-GKP, LV-KAN, LV-KAO, LV-KHT, LV-KHU

SYSTEM ARMING

The crew may arm the system by pressing the LO, MED, or MAX pushbutton provided all the following arming conditions are met :
- Green pressure available
- Antiskid electrically-powered
- No failure in the braking system
- At least two PRIMs are available and able to command the ground spoilers extension
- At least one ADIRU available.

Note: Autobrake may be armed with the parking brake on.

Ident.: DSC-32-30-10-A-00018919.0007001 / 17 OCT 17
Applicable to: LV-GIF

SYSTEM ACTIVATION

Automatic braking is activated:
- At the command for ground spoilers extension (*Refer to DSC-27-10-20 Speedbrake and Ground Spoiler Control - Speedbrake Control*), for LO and MED modes, or
- At the command for ground spoilers extension, when the wheel speed is above 40 kt and when the nose landing gear is compressed, for MAX mode.

Consequently in the event of an acceleration stop, if the deceleration is initiated with the wheel speed below 72 kt, the automatic braking will not activate because the ground spoilers will not be extended.
The active AUTO BRK mode is displayed in green on the Flight Mode Annunciator (FMA).

Ident.: DSC-32-30-10-A-00018919.0008001 / 17 OCT 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GKO, LV-GKP, LV-KAN, LV-KAO, LV-KHT, LV-KHU

SYSTEM ACTIVATION

Automatic braking is activated:
- At the command for ground spoilers extension (*Refer to DSC-27-10-20 Speedbrake and Ground Spoiler Control - Speedbrake Control*), for LO and MED modes, or
- At the command for ground spoilers extension, when the wheel speed is above 40 kt and when the nose landing gear is compressed, for MAX mode.

Consequently in the event of an acceleration stop, if the deceleration is initiated with the wheel speed below 72 kt, the automatic braking will not activate because the ground spoilers will not be extended.

Ident.: DSC-32-30-10-A-00018920.0005001 / 21 MAR 17
Applicable to: ALL

SYSTEM DEACTIVATION

The system deactivates when :
- Autobrake is disarmed (*Refer to DSC-32-30-10 System Disarming*), or
- Landing roll is completed and ground spoilers retract. In this case, LO or MED mode is also disarmed.

Ident.: DSC-32-30-10-A-00018921.0001001 / 21 MAR 16
Applicable to: ALL

SYSTEM DISARMING

The system is disarmed by :
- Pressing the pushbutton of the corresponding armed autobrake mode, or
- Losing one or more arming conditions, or
- Applying sufficient deflection to at least one brake pedal when autobrake is active in MAX, MED or LO mode, or
- After takeoff, or touch and go.

OPERATION

Applicable to: ALL

Ident.: DSC-32-30-10-B-00018922.0001001 / 21 MAR 16

GENERAL

There are four operation modes which are:
- Normal braking
- Alternate braking with antiskid
- Alternate braking without antiskid
- Parking brake.

Ident.: DSC-32-30-10-B-00000869.0002001 / 21 MAR 16

NORMAL BRAKING

Antiskid is operative and autobrake is available.

Braking is normal when:
- Green hydraulic pressure is available
- main landing gear in ground condition
- A/SKID and N/W STRG switch is ON

The control is electrically- achieved through the BSCU either via :
- The pedals, or
- Automatically:
  - on ground by autobrake system
  - in flight by setting the landing gear lever to the up position

The antiskid system is controlled by the BSCU, via the normal servo valves.
No brake pressure indication is provided.

Ident.: DSC-32-30-10-B-00018924.0001001 / 17 MAR 17

ALTERNATE BRAKING WITH ANTISKID

Autobrake is inoperative.

Active when green hydraulic pressure is insufficient and provided :
- Blue hydraulic pressure is available
- A/SKID & N/W STRG sw is ON
- PARKING BRAKE is not ON.

Note: *Alternate braking is also active in flight, when the landing gear is up.*

The automatic switching between the green and blue system is achieved by an automatic hydraulic selector.
Control is achieved by the pedals through the auxiliary low hydraulic pressure distribution line acting on the dual valves. The BSCU controls antiskid system via the alternate servo valves.
Brake pressure, as well as accumulator pressure, are indicated on a triple indicator located on the center instrument panel.

Note: *Initial pedal force or displacement produces more braking action in alternate mode than in normal mode.*

Ident.: DSC-32-30-10-B-00018925.0001001 / 17 MAR 17

ALTERNATE BRAKING WITHOUT ANTISKID

Autobrake and antiskid are inoperative.

The antiskid system is either deactivated:
- Electrically (A/SKID & N/W STRG sw is OFF, or power supply failure, or BSCU failure), or
- Hydraulically (B + G system low pressure, the brakes are supplied by the brake accumulator only).

Control is achieved by the pedals (acting on the dual valves). Alternate servo valves are fully open.
Brake pressure and accumulator pressure are indicated on a triple indicator, located on the center instrument panel. The pilot must modulate brake pressure at, or below, 1 000 PSI in order to avoid wheel locking.
Accumulators are designed to supply at least 7 full brake applications.

Note: *Initial pedal force or displacement produces more braking action in alternate mode than in normal mode.*

Ident.: DSC-32-30-10-B-00000872.0001001 / 21 MAR 16

PARKING BRAKE

Brakes are supplied by the blue hydraulic system, or by accumulator pressure via the dual shuttle valves. Alternate servo valves are open allowing full pressure application.
The accumulator maintains the parking pressure for at least 12 h.
If the parking brake is activated and no blue hydraulic or accumulator brake pressure is available, then the normal braking system can be applied via the brake pedals.
Blue accumulators can be pressurized by pressing the blue electrical pump switch. Brake pressure, as well as accumulator pressure, are indicated on a triple indicator located on the center instrument panel.

Ident.: DSC-32-30-10-B-00018927.0001001 / 21 MAR 16

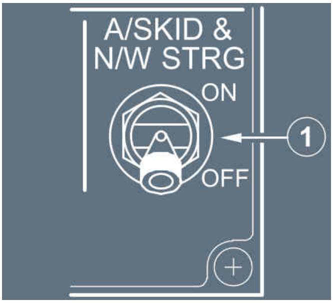
CENTER INSTRUMENT PANEL

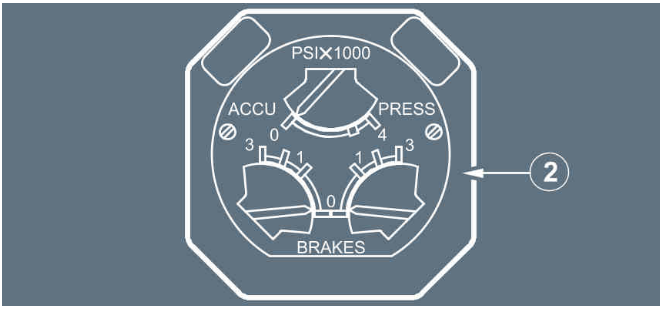
Ident.: DSC-32-30-20-00018931.0002001 / 21 MAR 16
Applicable to: ALL



(1) A/SKID & N/W STRG sw

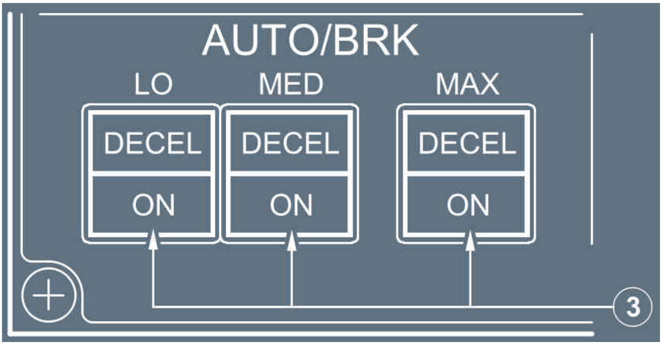
ON : - If green hydraulic pressure is available, antiskid and nose wheel steering are available.
- If green hydraulic pressure is lost:
  - Blue hydraulic pressure automatically takes over to supply the brakes
  - Antiskid remains available
  - Nose wheel steering is lost
  - Brake blue pressure is displayed on the triple indicator.

OFF : - Blue hydraulic pressure supplies the brakes:
  - Antiskid is deactivated. Brake pressure has to be limited by the pilot by refering to the triple indicator to avoid wheel locking
  - Nose wheel steering is lost
  - Differential braking remains available by pedals
  - Brake blue pressure is displayed on the triple indicator.



(2) BRAKES and ACCU PRESS indicator

ACCU PRESS indication	:	- green band	:	allowed pressure area in the brake accumulators. Provides full pressure to the brakes.
		- amber band	:	forbidden pressure area. Necessitates a repressurization of the accumulators.
BRAKES pressure indication	:	Indicates blue pressure delivered to left and right brakes measured upstream of the alternate servovalves.		



(3) AUTO BRK panel

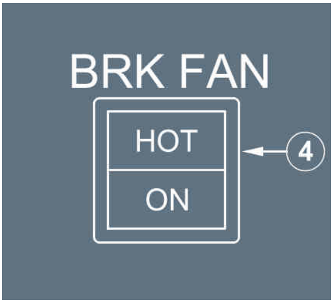
The springloaded MAX, MED, and LO pushbutton switches arm the appropriate deceleration rate:

- MAX mode is normally selected for take off.
  In the case of an aborted takeoff, maximum pressure goes to the brakes, as soon as the system generates the ground spoiler deployment order.
- MED or LO mode is normally selected for landing.
  - When LO is selected, progressive pressure goes to the brakes 1 s after ground spoiler deployment order, in order to decelerate the aircraft at 1.8 m/s^2 (5.9 ft/s^2).
  - When MED is selected, progressive pressure goes to the brakes starting at ground spoiler deployment order, in order to decelerate the aircraft at 3 m/s^2 (9.8 ft/s^2).

ON : The ON light illuminates blue to indicate positive arming.
The DECEL light illuminates green only if the autobrake function is active and when actual aircraft deceleration corresponds to predetermined rate. (In LO or MED : 80 % of the selected rate ; in MAX : 2.65 m/s² (8.7 ft/s²)). This occurs approximately 8 (5) seconds after activation for LO (MED) using only the brakes. Predetermined rates can also be achieved by using only the reversers or a combination of both reversers and brakes.

Note: *On a slippery runway, the predetermined deceleration may not be reached due to the slippery runway condition. In this case, the DECEL light will not come on, even if autobrake is active (ACTIV light ON).*

Off : The corresponding autobrake mode is not armed.



(4) BRK FAN pb ◁✳

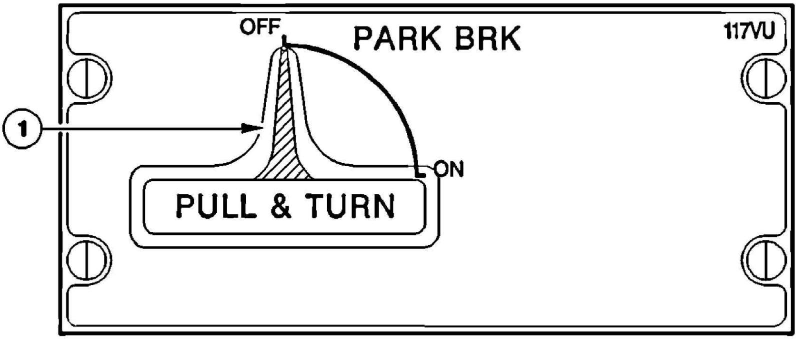
ON : The brake fans run, provided the main landing gear is downlocked.
The ON legend comes on in white.

Off : The brake fans stop.

HOT lt : Comes on amber, along with the associated ECAM caution, when one brake temperature exceeds 300 °C.

PEDESTAL

Ident.: DSC-32-30-20-00018932.0001001 / 21 MAR 16
Applicable to: ALL



(1) PARK BRK handle
Pull the handle, then turn it clockwise to apply the parking brake.
For A340-500/600, the activation of the parking brake deactivates all the other braking modes.
The "PARK BRK" message is displayed on the ECAM memo page.

CAUTION	As long as the handle is not in the "ON" position, the parking brake is not applied.

(1) NORM BRK indication

Appears in amber in case of:
- Normal braking is failed, or
- A/SKID & NWS sw is at OFF (associated with ECAM caution), or
- Both BSCU channels are failed (associated with ECAM caution).

(2) ANTISKID indication

Appears amber associated with an ECAM caution in case of total BSCU failure or when the A/SKID & NWS sw is OFF or in case of anti-skid failure detected by the BSCU or in flight with at least one engine running when green and blue systems are failed.

(3) AUTO BRK indication

Displayed :
- In green when the autobrake is armed.
- In amber and an associated ECAM caution comes on in case of autobrake system failure, or failure of both BSCU channels.

MAX, MED or LO indicates the selected rate (green). It is not displayed when the autobrake is faulty.

(4) Wheel number identification
Indication is displayed in white.

(5) III indications

It appears in green when:
- In flight, the landing gear is extended, and the antiskid is valid, or
- On ground, when antiskid is activated and the brakes are released.

It is amber in case of:
- Residual pressure, or
- Brake release fault.

Note: The III indications do not appear if the Alternate Nose Wheel Steering is active (i.e. if the ALTN NWS pb is switched to ON).

The R (Release) indication is always in white.

(6) Brake temperature indications

- It is normally green (minimum indication 0 °C).
- The green arc appears on the hottest wheel, when one brake temperature exceeds 100 °C.
- The amber light, and associated ECAM caution, come on when the corresponding brake temperature exceeds 300 °C.
  In addition, on the hottest wheel, the arc becomes amber.

Note: Below 100 °C, the indicated brake temperature may be below the actual brake temperature. This difference can reach 25 °C with an actual brake temperature of 30 °C, and it decreases when the temperature increases.

MEMO DISPLAY

Applicable to: ALL

The Tire Pressure Indicating System (TPIS) includes:
- A sensor which measures the pressure of each tire
- A transmission unit which transmits the electrical pressure signal from the sensor to the computer
- A Tire Pressure Indicating Unit (TPIU) which sends informations to the ECAM for cautions and system page display.

The instrument panel has both integral instrument lighting and flood lighting.
The brightness of all panel lighting is adjustable.
Spot lights and flood lights provide lighting for all work surfaces and the side consoles.
Two dimmable dome lights provide lighting for the overall cockpit.

Intentionally left blank

DESCRIPTION

Ident.: DSC-33-10-20-00000677.0002001 / 06 JAN 16
Applicable to: LV-GKO, LV-GKP

INSTRUMENT AND PANEL INTEGRATED LIGHTING

All instruments and panels installed in the cockpit (other than the DU) are integrally lit.
The brightness of all instruments and panels can be adjusted.

ANNUNCIATOR LIGHT TEST AND DIMMING

The brightness of all the annunciator lights in the flight deck can be adjusted, depending on the ANN LT TEST / BRT / DIM sw position on the overhead panel.
The lights are dimmed to a fixed level.
An annunciator light test is provided to verify cockpit annunciator lamp operation.
The test is done by selecting the TEST position on the ANN LT «TEST / BRT / DIM» sw, and by visually checking that all lights illuminate.

(2, 3, 4) Dome lights and lighting strips:
Two dome lights and lighting strips supply general cockpit illumination providing shadow free lighting.

(5, 6) Map holder lighting:
Map chart holder is provided at the CAPT and F/O stations.

(7, 8) Console and floor lighting:
Briefcase stowage, side console, and floor lighting are provided at the CAPT and F/O stations.

(1, 10) Centre instrument panel and standby compass:
The centre instrument panel is lighted by a set of lights located below the glareshield. The standby compass is provided with integral illumination.

(F) Reading lights:
Individual reading lights, and supplementary reading lights, are provided at the CAPT and F/O stations.

(9) Pedestal lighting:
Located in the middle of the overhead panel, a flood light illumination of the center pedestal.

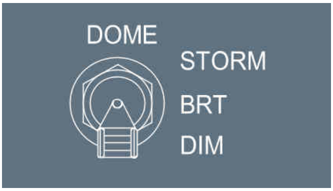
Turns the reading lights on and off, and adjusts their brightness.
There are two reading lights on the central part of the overhead panel.

(2) ICE IND ◁✳ & STBY COMPASS sw
This switch turns the standby compass light, the seat alignment indicator, and the external ice detector light ◁✳ on and off.

(3) CTL sw
A two-way switch that operates the dome lights. There is another two-way switch on the left rear panel (next to the cockpit door).

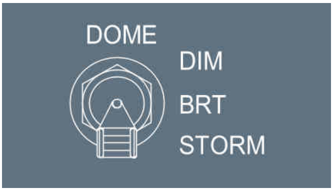
Note: *On ground, and when batteries are the only source of power, the dome light on the right automatically comes on, regardless of the switch position selected by the flight crew.*

(4) DOME sw
The DOME sw controls both dome lights. The DOME sw can have one of the two following configurations:



DOME
STORM
BRT
DIM

or



DOME
DIM
BRT
STORM

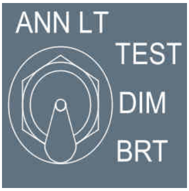
STORM : Sets the two dome lights, and the main instrument panel lights, to their maximum brightness.

BRT : Both dome lights are on and bright. (Provided that the flight crew uses the CTL sw, or the dome light switch on the rear left panel, to turn them on).

DIM : Both dome lights are on and dim. (Provided that the flight crew uses the CTL sw, or the dome lighting switch on the rear left panel, to turn them on).

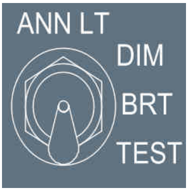
(5) ANN LT sw

The ANN LT sw controls all the flight deck annunciator lights. The ANN LT sw can have one of the two following configurations:



ANN LT
TEST
DIM
BRT

or



ANN LT
DIM
BRT
TEST

TEST : All flight deck annunciator lights turn on.The figure '8' is displayed on all Liquid Crystal Displays (LCD) of the FCU.

DIM : Reduces the brightness of all flight deck annunciator lights.

BRT : All flight deck annunciator lights operate normally.

This switch turns on and off the two flashing red lights, one on top and one on the bottom of the fuselage.

(2) WING sw
This switch turns on and off two beam lights on each side of the fuselage. These lights provide lighting on the wing leading edge and on the engine air intake to detect ice accretion. The wing and engine scan lights go off when the door 2 (LH or RH) opens for aircraft equipped with an automatic control logic of the wing and engine scan lights ◁✳ .

(3) NAV & LOGO sw
There are navigation lights on each wing tip and in the APU tail cone.
There are logo lights on in the upper surface of each horizontal stabilizer. These lights provide lighting for the company logo on the vertical stabilizer.

2 : Turns on NAV 2 and the LOGO lights.

AUTO 1 : Turns on NAV 1.
Turns on the LOGO lights when the main landing gear is compressed or, depending on the aircraft configuration, when flaps are extended (at least 15 ° on some aircraft).

OFF : The NAV and the LOGO lights are off.

(4) NOSE sw

This switch turns the taxi and takeoff lights on and off.

T.O : Turns on both taxi and takeoff lights.

TAXI : Turns on only taxi light.

OFF : Taxi and takeoff lights are off.

Note: *These two lights, attached to the nose gear strut, go off automatically when the landing gear is retracted.*

(5) LAND sw

This switch turns on and off the landing lights.

(6) RWY TURN OFF sw

This switch turns the runway turn-off lights on and off.

Note: *These lights go off automatically when the landing gear is retracted.*

(7) STROBE sw

This switch turns on and off the three synchronized strobe lights, one on each wing and one below the tail cone.

ON : The strobe lights flash white.

AUTO : The strobe lights come on automatically when the main landing gear is not compressed.

OFF : The strobe lights are off.

GENERAL

Ident.: DSC-33-30-10-00017993.0001001 / 21 MAR 16
Applicable to: ALL

Emergency lighting consists of the following:
- Cabin emergency lighting:
  - Proximity emergency escape path marking system (escape path and exit markers),
  - Overhead emergency lights, and
  - EXIT signs.
- Escape slide lighting.

Intentionally left blank

OPERATION

Ident.: DSC-33-30-20-00017959.0001001 / 21 MAR 16
Applicable to: LV-KAN, LV-KAO

- The proximity emergency escape path marking, overhead emergency lighting, and EXIT signs come on, if the EMER EXIT LT sw is at ON, or if the EMER pb on the Purser's panel is pressed.
- The cabin emergency lighting system is supplied as follows:
  - The DC ESS BUS and AC BUS 1 supply the cabin emergency lighting.
  - If the DC ESS BUS fails, internal batteries provide power to the cabin emergency lighting.
  - In nominal case, the DC ESS BUS charges these internal batteries.
- The escape slides are equipped with an integral lighting system. The escape slide lights come on automatically, when the slide is armed and the door is open. They have the same supply as the cabin emergency lighting.

OPERATION

Ident.: DSC-33-30-20-00017959.0010001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT, LV-KHU

- The floor proximity emergency escape path marking is a self-luminescent system.
- The exit markers of the proximity emergency escape path marking, the overhead emergency lighting, and the EXIT signs come on, if the EMER EXIT LT sw is ON, or if the Purser panel's EMER pb is pressed.
- The cabin emergency lighting system is supplied as follows:
  - The DC ESS BUS and AC BUS 1 supply the cabin emergency lighting.
  - If the DC ESS BUS fails, internal batteries provide power to the cabin emergency lighting.
  - In nominal case, the DC ESS BUS charges these internal batteries.
- The escape slides are equipped with an integral lighting system. The escape slide lights come on automatically, when the slide is armed and the door is open. They have the same supply as the cabin emergency lighting.

OVERHEAD PANEL

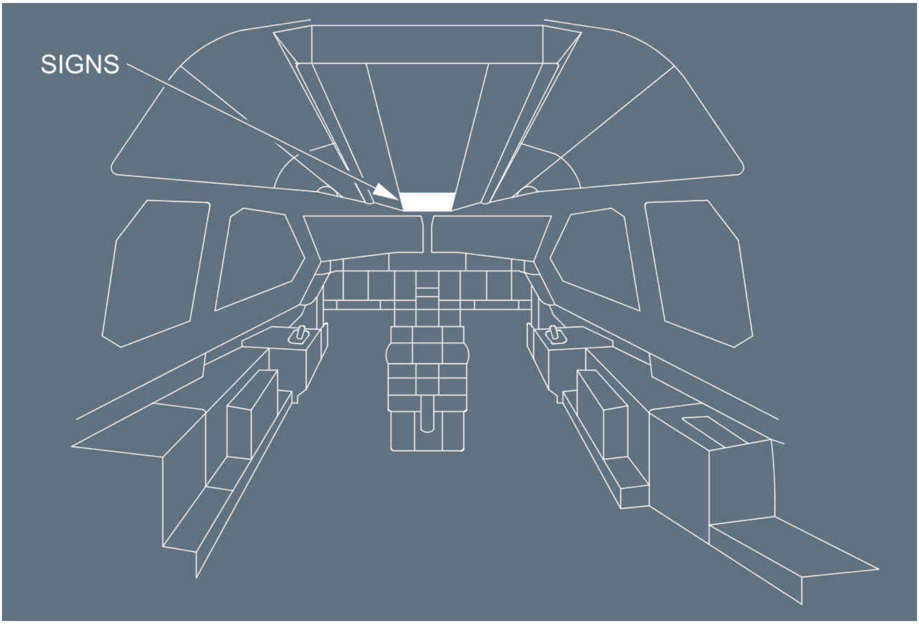
Ident.: DSC-33-40-10-00017948.0001001 / 21 MAR 16
Applicable to: ALL



The switches described below are installed on the SIGNS panel on the overhead panel.

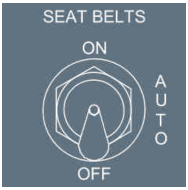
The cabin signs consist of the following:
- a SEAT BELTS sw, and
- a NO SMOKING sw ◁ , or
- an EXIT sw ◁ , or
- a NO PORTABLE ELEC DEVICE sw ◁ .

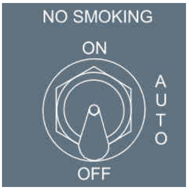
The SEAT BELTS sw activates the FASTEN SEAT BELT and RETURN TO YOUR SEAT signs.
The NO SMOKING sw ◁ activates the EXIT and NO SMOKING signs.
The NO PORTABLE ELEC DEVICE sw ◁ activates the EXIT and NO MOBILE signs.
A low tone chime sounds (depending on CIDS/CAM Programming) each time a sign goes on or off.
Each switch has 3 positions:

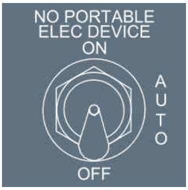
ON	:	Signs are on in the cabin
AUTO ◁	:	Signs are on in the cabin when either landing gear is extended or flaps/slats are extended (position 1, 2, 3 or FULL)

OFF : Signs are off in the cabin

Example of switches layout:







Note: *In the event of excessive cabin altitude, the cabin lights (depending on CIDS/CAM programming) and all the cabin signs, except the NO PORTABLE ELEC DEVICE signs ◁, come on regardless of switches position.*

Applicable to: ALL

The Air Data and Inertial Reference System (ADIRS) supplies temperature, anemometric, barometric and inertial parameters to the EFIS system (PFD and ND) and to other user systems (FMGEC, FADEC, PRIM, SEC, FWC, SFCC, ATC, GPWS, CMC, CPC).

The system includes:

- Three identical ADIRUs (Air Data and Inertial Reference Units).

  Each ADIRU is divided in two parts, either of which can work separately in case of failure in the other:
  - The ADR (Air Data Reference) part which supplies barometric altitude, airspeed, Mach, angle of attack, temperature and overspeed warnings.
  - The IR (Inertial Reference) part which supplies attitude, flight path vector, track, heading, accelerations, angular rates, ground speed, vertical speed and aircraft position.
- One ADIRS control panel on the overhead panel for selection of modes (NAV, ATT, OFF) and indications of failures.
- Four types of sensors:
  - Pitot probes (3)
  - Static pressure probes (STAT) (6)
  - Angle of attack sensors (AOA) (3)
  - Total air temperature probes (TAT) (2)

  These sensors are electrically heated to prevent from icing up.
- Eight ADMs (Air Data Modules) which convert pneumatic data from PITOT and STAT probes into numerical data for the ADIRUs.
- A switching facility for selecting ADR3 or IR3 for instrument displays in case of ADIRU1 or 2 failure.
- A MAG/TRUE pb-sw for polar navigation.

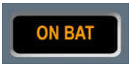
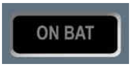
ON BAT LIGHT



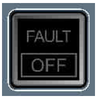
Batteries supply at least one ADIRU. The ON BAT light also comes on for a few seconds at the beginning of a complete IRS alignment.
The ON BAT light does not come on in the case of a fast alignment.

Note: *When the aircraft is on ground and if at least one ADIRU is supplied by aircraft batteries:*
- *An external horn sounds*
- *The ADIRU light comes on amber on the SERVICE INTERPHONE BAY panel.*

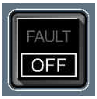


One of the following applies:
- All three ADIRUs are on, and not supplied by batteries, or
- All three ADIRUs are off.

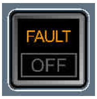
IR 1(2)(3) pb-sw



IR 1(2)(3) is on.
When pressed, turns off the IR 1(2)(3).

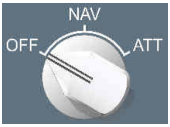


IR 1(2)(3) is off.
When pressed, turns on the IR 1(2)(3).

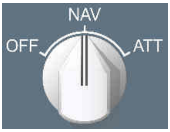


IR 1(2)(3) is failed.
Associated with the NAV IR 1(2)(3) FAULT alert (*Refer to procedure*).
When IR 1(2)(3) FAULT light flashes, the attitude and heading information may be recovered in ATT mode.
When IR 1(2)(3) FAULT light is steady, the IR 1(2)(3) is lost.
When pressed, turns off the IR 1(2)(3). The FAULT light goes off.

IR 1(2)(3) Mode selector

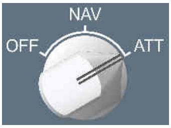


ADIRU 1(2)(3) is not energized.
Both the IR 1(2)(3) data and the ADR 1(2)(3) data are not available.



IR 1(2)(3) operates in NAV mode.
IR 1(2)(3) provides full inertial data to the aircraft systems.

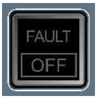
Note: *ADR 1(2)(3) provides full air data to the aircraft systems.*



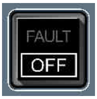
IR 1(2)(3) operates in ATT mode.
IR 1(2)(3) only provides attitude and heading data (if entered by the flight crew). The navigation data are not available.
The heading must be entered through the MCDU and has to be reset frequently (about every 10 min).

Note: *During the flight, if the IR mode selector is set from NAV to ATT or NAV to OFF, the NAV mode is lost for the remainder of the flight.*
When in ATT mode, the flight crew can only recover the NAV mode on ground via a complete alignment.

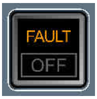
ADR 1(2)(3) pb-sw



ADR 1(2)(3) is on.
When pressed, turns off the ADR 1(2)(3).



ADR 1(2)(3) is off.
When pressed, turns on the ADR 1(2)(3).



ADR 1(2)(3) is failed.
Associated with the NAV ADR 1(2)(3) FAULT alert (*Refer to procedure*).
When pressed, turns off the ADR 1(2)(3). The FAULT light goes off.

NORM : ADIRU1 supplies data to PFD1, ND1, DDRMI ◁ and ATC1.
ADIRU2 supplies data to PFD2, ND2 and ATC2.

CAPT ON 3 : ADR3 or IR3 replaces ADR1 or IR1.

F/O ON 3 : ADR3 or IR3 replaces ADR2 or IR2.

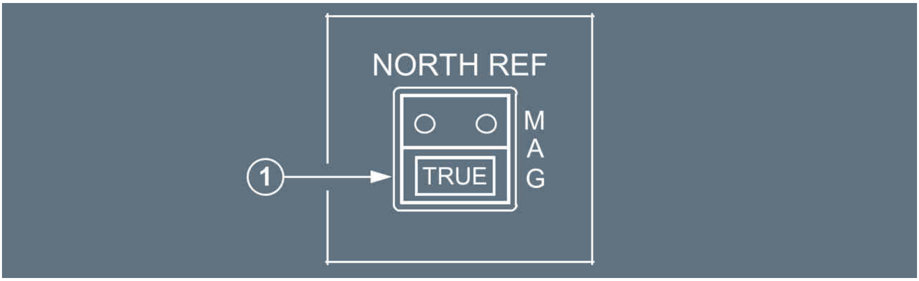
MAIN INSTRUMENTS PANEL

Ident.: DSC-34-10-10-20-00018963.0001001 / 21 MAR 16
Applicable to: ALL

When entering in the following area, the ADIRUs will trigger the message “SELECT TRUE REF” on ND requesting to change north reference:

- North of 73 ° North, between 90 ° West and 120 ° West (magnetic polar region), and
- North of 82 ° North, and
- South of 60 ° South.

When the NORTH REF pb-sw is set to TRUE, the ADIRUs replace magnetic heading by true heading on EFIS and DDRMI ◁ . In addition, the GRID track appears on ND.



(1) NORTH REF pb-sw

TRUE (in) : Pressing this pushbutton-switch selects the true heading for instrument display.
TRUE light comes on blue.

MAG (out) : Magnetic heading is selected.

MEMO DISPLAY

Applicable to: ALL

Ident.: DSC-34-10-10-20-A-00017200.0001001 / 21 MAR 16

ADIRS SWTG : This memo appears in green when either the AIR DATA or the ATT HDG selector is not in the NORM position.

Ident.: DSC-34-10-10-20-A-00017196.0001001 / 04 JUN 19

IR XXX IN ATT ALIGN : This memo appears during an IR alignment in Attitude mode.

Ident.: DSC-34-10-10-20-A-00017197.0001001 / 21 MAR 16

IRS IN ALIGN : This memo appears in amber if engines are running.

IRS IN ALIGN : This memo flashes in green if IRS alignment is faulty.

Ident.: DSC-34-10-10-20-A-00017195.0001001 / 21 MAR 16

IRS IN ALIGN XXX : This memo appears in green during an IR alignment.

Ident.: DSC-34-10-10-20-A-00017198.0001001 / 21 MAR 16

TRUE NORTH REF : This memo appears in green when the NORTH REF pb-sw is at TRUE. The message pulses for 10 s in flight phase 1 or 2, or at slats' extension.

MAXIMUM DIFFERENCES BETWEEN SPEED/MACH INDICATIONS

Ident.: DSC-34-10-10-20-00020923.0001001 / 10 MAY 21
Applicable to: ALL

The following table details the TSM values used to determine if a maintenance task is due when a difference between Speed/Mach indications is observed.
They are provided in order for flight crews to determine if indeed maintenance actions should be requested.

FL	SPEED	SPEED/MACH COMPARISON BETWEEN					
		ADR1 and ADR2 (on PFD)		ADR3 and ADR1 or ADR3 and ADR2 (on PFD)		Standby Airspeed Indicator and any ADR 1 or 2 or 3	
		kt	Mach	kt	Mach	kt	Mach on ISIS ◁ (1)
GND CHECK	-	6 kt	M 0.008	6 kt	M 0.008	6 kt	-
FL 50	250 kt	4 kt	M 0.010	4 kt	M 0.010	7 kt	-
FL 100	250 kt	4 kt	M 0.009	4 kt	M 0.009	7 kt	M 0.030
FL 200	300 kt	3 kt	M 0.008	3 kt	M 0.009	8 kt	M 0.031
FL 300	M 0.82	3 kt	M 0.009	3 kt	M 0.009	8 kt	M 0.025
FL 410	M 0.82	4 kt	M 0.009	4 kt	M 0.009	7 kt	M 0.023

(1) *Mach values lower than M 0.50 in climb, and M 0.45 in descent, are not displayed on ISIS ◁ .*

Intentionally left blank

Backup Speed/Altitude Scale

BACKUP SPEED/ALTITUDE SCALE - GENERAL

Ident.: DSC-34-10-10-30-10-00000729.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GKO, LV-KAN, LV-KAO, LV-KHT, LV-KHU

GENERAL

The BackUp Speed Scale (BUSS) enables to fly the aircraft when airspeed indications are unreliable.

When the BUSS is activated:
- The BUSS replaces the normal speed,
- The GPS altitude replaces the barometric altitude scales.

The BUSS is displayed on both PFDs when the flight crew turn off all ADRs.
The activation of this BUSS is not reversible.
The BUSS information is based on the angle of attack (AOA), and depends on the slat/flap configuration.

BACKUP SPEED/ALTITUDE SCALE - GENERAL

Ident.: DSC-34-10-10-30-10-00000729.0002001 / 21 MAR 16
Applicable to: LV-GHQ, LV-GIF, LV-GKP

GENERAL

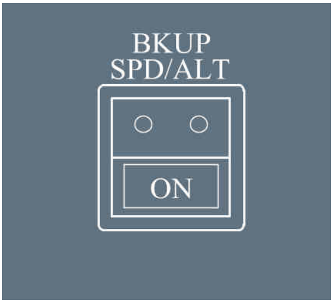
The BackUp Speed Scale (BUSS) enables to fly the aircraft when airspeed indications are unreliable.

When the BUSS is activated:
- The BUSS replaces the normal speed,
- The GPS altitude replaces the barometric altitude scale.

The use of the BUSS is reversible.

The reversible BUSS is activated and deactivated with two BKUP SPD/ALT pb available on the main instrument panel:
- One on the left of the Captain PFD,
- One on the right of the F/O PFD.

Each BKUP SPD/ALT pb independently commands the display of the BUSS on its associated side.



The BUSS information is based on the angle of attack (AOA), and depends on the slat/flap configuration.

ECAM ALERT AND MEMO

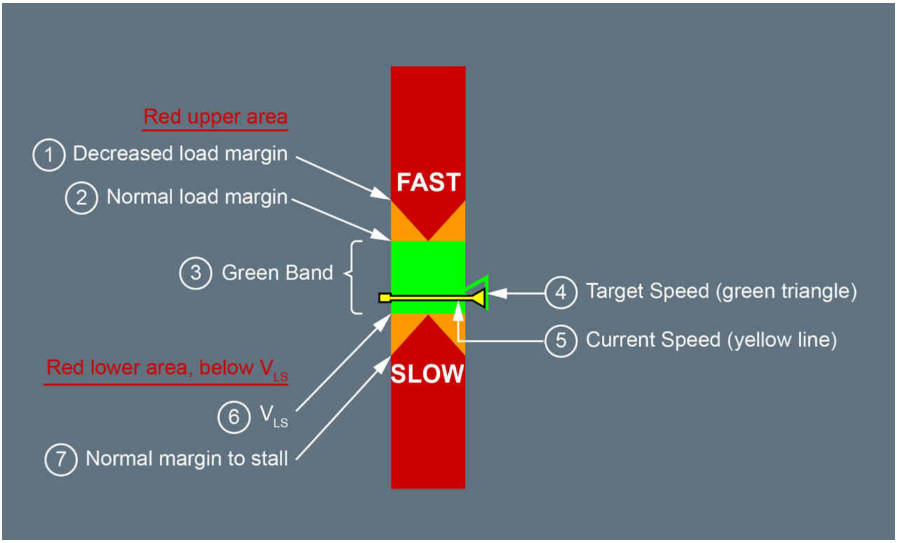
The ECAM displays a memo when the flight crew activates the BKUP SPD/ALT on one side: BKUP SPD/ALT.

The ECAM displays an alert when the flight crew activates the BKUP SPD/ALT:
- On one side with the AP and/or FD engaged on the same side,
  Refer to PRO-ABN-NAV NAV BKUP SPD/ALT ON CAPT(F/O) PFD, or
- On both sides,
  Refer to PRO-ABN-NAV NAV BKUP SPD /ALT ON CAPT+F/O PFD.

BACKUP SPEED/ALTITUDE SCALE - BACKUP SPEED SCALE

Ident.: DSC-34-10-10-30-10-00000730.0001001 / 21 MAR 16
Applicable to: ALL

BACKUP SPEED SCALE



Red upper area
1 Decreased load margin
2 Normal load margin
3 Green Band
Red lower area, below V_{LS}
6 V_{LS}
7 Normal margin to stall
FAST
SLOW
4 Target Speed (green triangle)
5 Current Speed (yellow line)

(1) Red FAST area
This area indicates the excessive speed range while decreasing the margin to the maximum structural speed.

(2) Amber FAST area
This area indicates the excessive speed range while keeping an appropriate margin to the maximum structural speed.

(3) Green area
The green area indicates the safe speed range.

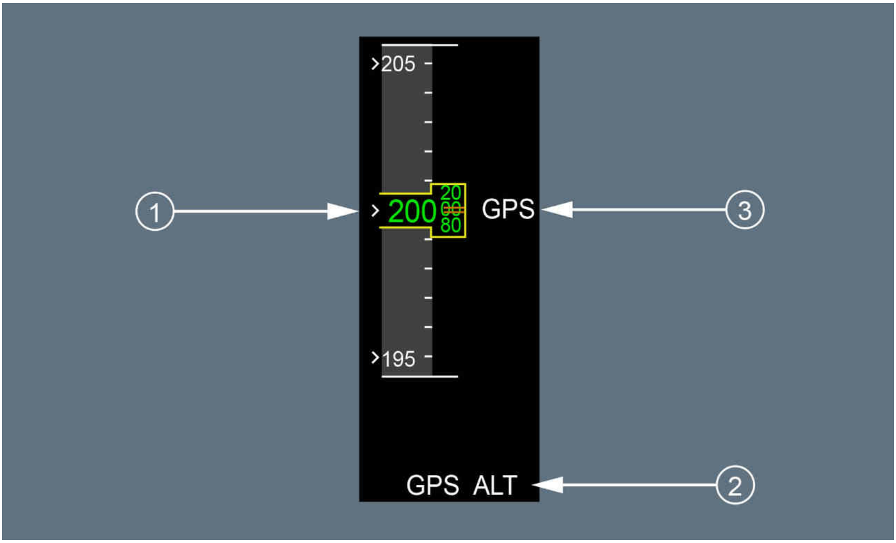
(4) Target speed (green triangle)
This symbol indicates the optimum target speed.
During the approach, it indicates the target speed for the approach.

(5) Actual speed reference (yellow line)
This line indicates the current speed of the aircraft.

(6) Amber SLOW area
This area indicates the too low speed range while keeping an appropriate margin to the stall speed.

(7) Red SLOW area
This area indicates the too low speed range while reducing the margin to the stall speed.

BACKUP ALTITUDE SCALE



(1) Current GPS altitude
Two amber dashes cover the last two digits.

(2) GPS ALT flag
This flag indicates that the barometric altitude is replaced by the GPS altitude.

(3) GPS flag (displayed depending of the aircraft configuration)
This flag indicates that the barometric altitude is replaced by the GPS altitude.

Note: *The vertical speed indication is no longer displayed.*

DESCRIPTION

Ident.: DSC-34-10-15-10-00018964.0001001 / 21 MAR 16
Applicable to: ALL

The Global Positioning System (GPS) is a satellite based radio navigation aid.
Worldwide 24 satellites broadcast accurate navigation data that the aircraft can use for the precise determination of its position.

The aircraft has two independent GPS receivers. Depending of the aircraft configuration, each receiver consists:
- Of a GPS Sensor Unit (GPSSU), or
- Is integrated in the Multi Mode Receiver (MMR). The GPS1 receiver in MMR1, and the GPS2 receiver in MMR2.

The GPSSU or the MMR processes the received data, and transfers them to the ADIRU. Then the ADIRU performs the GP-IRS hybrid position calculation. The FMGEC uses this hybrid position.

ADIRU3
ADIRU2

OPERATIONS

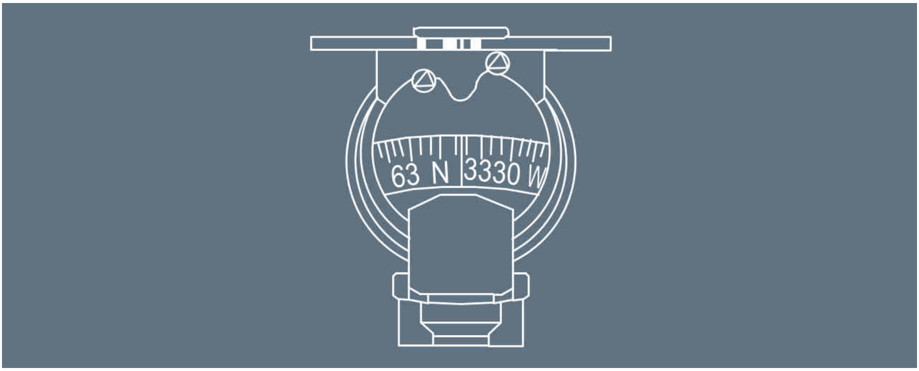
GPS information are available on the FMS – GPS Monitor Page. *Refer to DSC-22_20-50-10 Pages descriptions*.

- During normal operations
  The GPS receiver 1 supplies the ADIRU1 and the ADIRU3, and the GPS receiver 2 supplies the ADIRU2.
- In case of failure of one GPS receiver
  All ADIRUs use the operative GPS receiver.
- In case of failure of ADIRUs:
  - If the ADIRU1 fails, ADIRU3 is supplied by the GPS receiver 1, and ADIRU2 is supplied by the GPS receiver 2.
  - If the ADIRU2 fails, the ATT HDG selector has to be set to F/O 3 in order to maintain Side 1 and Side 2 segregation. In this case, the ADIRU3 will be supplied with GPS receiver 2.
  - If two ADIRUs fail, the remaining ADIRU is supplied by its own side GPS receiver.

COMPASS

Ident.: DSC-34-10-20-00019087.0001001 / 21 MAR 16
Applicable to: ALL

There is a compass located on top of the windshield center post.
The deviation card is located above the compass.



DESCRIPTION OF THE ISIS

Ident.: DSC-34-10-20-00019142.0001001 / 21 MAR 16
Applicable to: ALL

GENERAL

The ISIS system displays the following information:
- Attitude
- Airspeed and mach
- Altitude
- Barometric pressure
- LS function
- Bugs.

(1) "+"/"-" activation pushbuttons
Two pushbuttons, labelled "+" and "-", are used to adjust the level of brightness.
This brightness of the screen automatically adjusts after power-up tests. This is because of the photosensitive cell located on the surface of the ISIS system display.
The "+" and "-" pushbuttons then allow this initial brightness to be manually adjusted and changed.

(1) Fixed aircraft symbol
The fixed aircraft symbol is in black, and outlined in yellow.
Depending of the aircraft configuration, the center of the fixed aircraft symbol is a point (like on the illustration above) or "V-bars".

(2) Roll scale
The roll scale is in white.
The markers are at 0 (small yellow triangle), 10, 20, 30, 45, 60 ° of bank.

(3) Roll index
The roll index is in black, and outlined in white. It indicates the bank angle.

(4) Lateral acceleration index
The trapezoidal index moves beneath the roll index. It represents the aircraft's lateral acceleration.

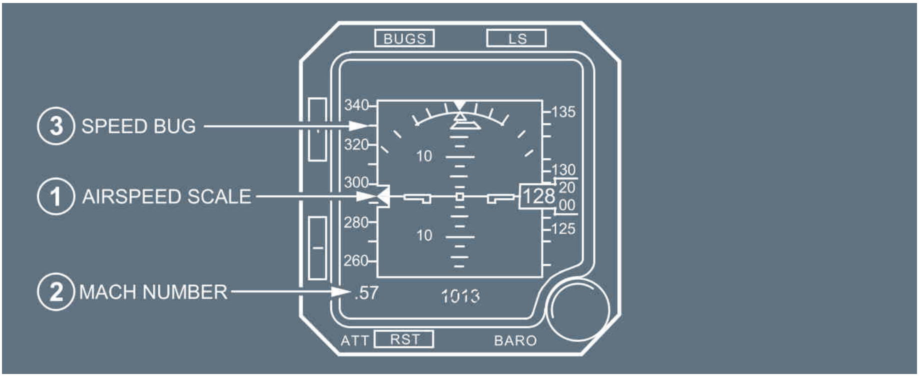
(5) Pitch scale
The pitch scale is in white. The scale shows markers every 2.5 °, between 30 ° nose up and 30 ° nose down. Beyond 30 °, large red arrowheads (V-shaped) indicate that the attitude has become excessive, and show the direction to follow in order to reduce it. The minimum pitch scale displayed is -17.5 ° +15 ° at 0 ° of pitch.

(6) ATT RST

The attitude indication can be reset by pressing this pushbutton for at least 2 s. The aircraft must be level during this procedure. During the reset time (approximately 10 s), the “ATT 10s” message is displayed on the screen. This pushbutton is also used to realign the system, if excessive aircraft movement is detected during the alignment phase.

AIRSPEED

Ident.: DSC-34-10-20-00019147.0002001 / 12 MAY 23
Applicable to: ALL



(1) Airspeed scale

A white scale moves in front of a yellow triangle indicating the airspeed. The scale ranges from 30 to 250 kt, with a mark every 5 kt, and from 250 to 520 kt, with a mark every 10 kt.

(2) Mach Number

The Mach number is displayed in green when it goes above 0.5. And it disappears when it goes below 0.45.

(3) Speed bug

When a speed bug is entered via the BUGS function, the corresponding speed mark is indicated by a cyan dash.

BARO

(1) Altitude indication
The altitude indication is given as a white moving scale, and a green digital readout on a grey background.
The altitude scale ranges from -2 000 ft to 50 000 ft, every 100 ft, with digital altitude indications every 500 ft.
For negative altitudes, “NEG” appears in the window in white.
The altitude box changes to cyan, when it also corresponds to a bug value.
Depending of the aircraft configuration, the altitude in meters is displayed above the altitude scale.

(2) Barometric reference
The barometric reference is displayed in cyan.

The displayed barometric reference is:
- The standard barometric reference "STD", or
- Depending of the aircraft configuration, the barometric pressure in "hPa" or "hPa / inHg".

(3) Barometric selection knob
This knob enables the selection of a barometric pressure, setting a variation of 10 hPa per knob rotation.
The standard barometric pressure can be selected by pressing the barometric knob. “STD” is then displayed, in place of the pressure value.
Pressing the knob again will display the selected barometric pressure.

(4) Altitude bug
When an altitude bug is entered through the bugs function, the corresponding altitude mark is indicated by a cyan dash, or by a cyan box when the dash covers the digital indication on the scale.

LANDING SYSTEM FUNCTION

1 LOCALIZER (or F-LOC ◁) SCALE AND INDEX

(1) Localizer / scale and index

(2) Glideslope / scale and index
When the LS pb is pressed, the deviation scales are displayed.
When deviation scales are displayed and the LS deviations are valid, the indexes appear.

The LS deviations that are displayed correspond to the LS approach:
- Selected on the MCDU, or
- Tuned on the RMP.

Note: The LS approach corresponds to either ILS approach, or GLS ◁ approach, or non precision approach using FLS ◁ .

(3) LS selection pushbutton
Pressing the LS pb will display the LS scales. Pressing the LS pb again will remove the LS scales.

CAUTION	Do not use the ISIS LS for takeoff using the localizer of the opposite runway, or for a back-course localizer approach. The LOC deviations are given in the wrong sense.

BARO

(1) BUGS function selection pushbutton
Pressing the BUGS pushbutton will activate the BUGS function, and display the bug values to be selected.

(2) SPD BUG and ALT BUG columns
The SPD BUG column gives four speed values (in knots) that can be selected by the crew.
The ALT BUG column gives two altitude values (feet) to be selected by the crew.

(3) BUGS value selection knob
It allows the bug value to be set by rotating the BARO knob. This value cannot be lower than 30 kt for a speed bug, or a negative value for an altitude bug.
Pressing the BARO setting knob, once a bug value box is activated, will deselect the bug value. The "OFF" label comes on close to the activated box.
The entered values are memorized by the system, when exiting the screen, by pressing the BUGS pushbutton (1), or after 15 s without any pilot action.

(4) "+"/"-" box activation buttons
Access from one box to another is obtained by pressing the "+" or "-" pushbutton.
When a bug value is entered, access to the next box is obtained by pressing the "-" pushbutton. The box becomes active and flashes.
The "+" pushbutton can be used to return to a previous box.

Note: *Use of the ISIS bugs function is not recommended because, in the event that both PFDs are lost in flight, when the ISIS bugs were previously set for takeoff, then for the approach, the bugs would remain at the takeoff characteristic speed settings.*

(1) ATT flag (red)
When attitude data is lost, the red ATT flag appears.

(2) SPD flag (red)
When airspeed data is lost, the red SPD flag appears.

(3) M flag (red)
When Mach number is lost, the red M flag appears.

(4) ALT flag (red)
When altitude data is lost, the red ALT flag appears.

(5) G/S flag (red)

When glideslope information is lost, the red G/S flag appears.

(6) LOC flag (red)

When localizer data is lost, the red LOC flag appears.

(7) ATT: RST (yellow)

The "ATT": RST flag appears:

- When excessive aircraft movement is detected during the alignment phase, or
- After 350 h of continuous electrical supply, or
- When the “WAIT ATT” flag is displayed during more than 10 s.

In the above cases, press the ATT RST pb to reset/realign and recover the attitude indication.

(8) MAINT flag (white)

Maintenance required. This “MAINT flag” does not affect ISIS operation.
Displayed only on ground phase (speed < 60 kt).

(9) OUT OF ORDER (white)

When an internal failure of the ISIS indicator occurs, the “OUT OF ORDER” message appears, accompanied by a fault code.

(10) WAIT ATT flag (yellow)

If the ISIS looses attitude data, its entire sphere is cleared to display the: “WAIT ATT” flag.

- If the “WAIT ATT” flag is displayed during less than 10 s, a normal operation is recovered.
- If attitude data are lost for more than 10 s, the “WAIT ATT” flag is then replaced by the “ATT: RST” flag.

(11) ATT 10 s flag (yellow)

This count down flag appears, when the flight crew press the ATT RST pb, in order to indicate that the attitude reset function is in progress.

Intentionally left blank

GENERAL

Ident.: DSC-34-10-30-10-00019185.0001001 / 20 MAR 17
Applicable to: ALL

Three modes of tuning are available:

1. **Automatic Tuning**
   This is the basic means for tuning navaids.
   In normal operation, the FMGEC tunes navaids automatically, with each FMGEC controlling its own receivers.
   If one FMGEC fails, the remaining FMGEC controls both sides receivers, after activation of the FM selector switch.
2. **Manual Tuning**
   The flight crew can use the MCDU to override the automatic tuning of navaids by FMGEC in order to select a specific navaid for visual display.
   This does not affect the automatic function of the FMGEC.
   Any entry on one MCDU is sent to both FMGEC in dual mode, or the remaining FMGEC in single mode.
3. **Back Up Tuning**
   If both FMGECs fail, the flight crew can use the RMPs (Radio Management Panels 1 and 2) on the pedestal for back up tuning.
   The CAPT RMP controls VOR1 and ADF1 ◁ .
   The F/O RMP controls VOR2 and ADF2 ◁ .
   Either RMP controls both ILS/GLS ◁ , provided "STBY NAV" is selected on RMP1 and RMP2.
   RMP3 ◁ is not used for navaids tuning.

VOR

Ident.: DSC-34-10-30-20-00019194.0001001 / 03 NOV 23
Applicable to: ALL

The aircraft has two VOR receivers.
The NDs display VOR 1 and VOR 2 information, in accordance with the position of the ADF ◁ /VOR sw on the EFIS control panel (*Refer to DSC-31-50 EFIS Control Panel*).
The DDRMI ◁ also displays VOR 1 and VOR 2 bearings, if the heading signal is valid.

ILS / GLS ◁

Ident.: DSC-34-10-30-20-00019195.0001001 / 29 MAY 20
Applicable to: ALL

The aircraft has two ILS/ GLS ◁ receivers.

Note: *When the aircraft is equipped with MMRs, ILS and GLS ◁ receivers are in the MMRs (ILS1/ GLS 1 ◁ in the MMR1 and the ILS2/ GLS 2 ◁ in the MMR2)*

- PFD1 and ND2 display ILS1/ GLS 1 ◁ information.
- PFD2 and ND1 display ILS2/ GLS 2 ◁ information.
- The PFD displays the ILS/ GLS ◁ information if the flight crew presses the LS pb or ILS pb (depending on the aircraft configuration) on the EFIS control panel (*Refer to DSC-31-50 EFIS Control Panel*).
- The NDs display ILS/ GLS ◁ information if the flight crew selects the ROSE LS mode or the ROSE ILS mode (depending on the aircraft configuration) on the EFIS control panel (*Refer to DSC-31-50 EFIS Control Panel*).

ADF ◁

Ident.: DSC-34-10-30-20-00019207.0001001 / 03 NOV 23
Applicable to: ALL

The aircraft may be fitted with one ADF ◁ or two ADFs ◁ .
The NDs display ADF ◁ information, depending on the position of the ADF ◁ /VOR sw on the EFIS control panel. *Refer to DSC-31-45 Rose Modes*.
The DDRMI ◁ also displays ADF 1 ◁ and ADF 2 ◁ bearings, depending on the position of the ADF ◁ /VOR sw on the DDRMI ◁ .

DME

Ident.: DSC-34-10-30-20-00019211.0001001 / 20 MAR 17
Applicable to: ALL

The aircraft has two DMEs.

The frequency that is automatically set on the DME corresponds to the frequency/channel that is set on the VOR, or ILS, or GLS ◁ .
One DME receiver is capable to tune simultaneously several frequencies from different DME ground stations.
Some frequencies are tuned for FMS radio position computation in VOR/DME mode and in DME/DME mode. Other frequencies are tuned for VOR/DME display and ILS/DME display.
The NDs and the DDRMI ◁ can display DME information associated with VOR,
The PFDs can display DME information associated with ILS/ GLS ◁ *Refer to DSC-31-40 Trajectory Deviation - ILS Approach (Cont'd)*

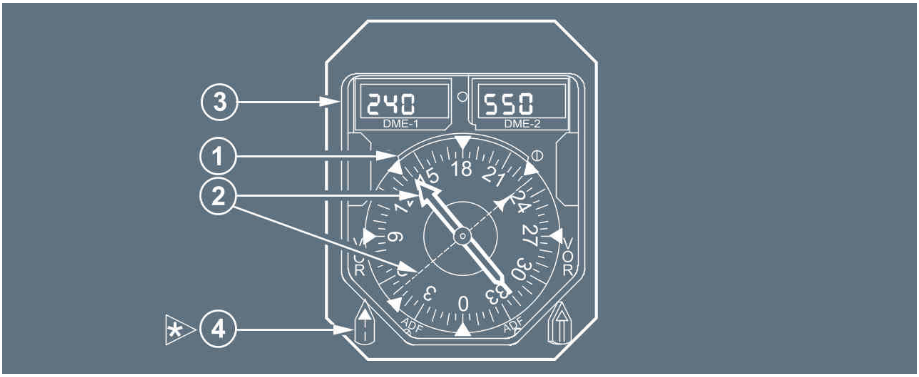
MARKER BEACON

Ident.: DSC-34-10-30-20-00019212.0001001 / 21 MAR 16
Applicable to: ALL

One marker beacon system is included in VOR receiver 1.
The PFD displays the outer, middle and inner marker signals (*Refer to DSC-31-40 Trajectory Deviation - ILS Approach (Cont'd)*).

DIGITAL DISTANCE AND RADIO MAGNETIC INDICATOR (DDRMI) ◁✳

Ident.: DSC-34-10-30-30-00019213.0001001 / 21 MAR 16
Applicable to: ALL



(1) Compass Card
ADIRU1 normally supplies the signal that positions the compass card.
ADIRU3 supplies this signal when selected by the ATT HDG SWITCHING selector.
Heading reference is in MAG or TRUE as selected by the NORTH REF pb-sw.

(2) Bearing Pointers
Indicate the magnetic bearing to the station received by VOR1 or ADF1 ◁✳ (dashed pointer) and VOR2 or ADF2 ◁✳ (double pointer).

Note: *Depending on the quality of the VOR beacon's signal, and mainly at distances greater than 25 NM from the station, the processing of the signal, on aircraft equipped with COLLINS or BENDIX VOR may lead to bearing pointer oscillations.*

(3) DME1(2) Counters
Indicates distance in nautical miles to/from DME station.

The counters indicate distances:
- in NM when the station is at more than 20 NM
- 1/10 th of NM when the station is at less than 20 NM

When the station is at less than 1 NM, 0 is shown.
The DME1 and DME2 displays are blanked or dashed when a fault is detected or data invalid.

(4) VOR/ADF Selector ◁

- VOR1 or ADF1 ◁ on the dashed pointer.
- VOR2 or ADF2 ◁ on the double pointer (if ADF2 is not installed, then ADF1 may be selected).

The DDRMI has also VOR/ADF flags and HDG flags when the associated information is not available

The indicators display these flags if:
- The VOR or ADF receiver fails (associated to the VOR/ADF flag only),
- The DDRMI has an internal failure,
- The heading signal from ADIRS is not valid,
- The power supply fails.

As long as the VOR/ADF flag is shown, and depending of the aircraft configuration, the associated bearing pointer remains:
- At the last valid position, or
- Into the horizontal line.

Note: *In EMER ELEC configuration, only the VOR1 or ADF1 ◁ are available, according to the position of the VOR1/ADF1 selector.*

RADIO MANAGEMENT PANEL (RMP)

ON/OFF sw

This switch controls the power supply to the panel.

NAV pb-sw (WITH TRANSPARENT SWITCHGUARD)

- Pressing this key engages the radio navigation backup mode. It takes control of the VOR, ILS, GLS ◁ and ADF ◁ receivers away from the FMGEC and gives it to the RMP. The green monitor light comes on.

  Note: *Pressing the MLS key has no effect.*

- Pressing the NAV key a second time returns control of the navigation radios to the FMGEC. The green monitor light goes off.

  Note:
  - *The flight crew must select this backup tuning mode on both RMP1 and RMP2 if both FMGECs or both MCDUs fail. In the emergency electrical configuration, only RMP1 receives power.*
  - *In the NAV backup mode, the flight crew can select radio communication systems as it would in the normal mode. Setting one RMP to NAV backup mode removes navaids tuning from both FMGECs.*
  - *Pressing the NAV key on RMP 3* ◁ *has no effect.*

RADIO NAVIGATION SELECTION KEYS

When the radio navigation back-up mode is on and the flight crew presses the VOR STBY NAV key, the ACTIVE window displays the VOR frequency/channel to which that receiver is tuned. The green monitor light on the selected key comes on, and the one on the previously selected STBY NAV key or COM key goes out.

When the radio navigation back-up mode is on and flight crew presses the ILS STBY NAV key, the ACTIVE window displays the ILS frequency/channel to which that receiver is tuned. The green monitor light on the selected key comes on, and the one on the previously selected STBY NAV key or COM key goes out.

When the radio navigation back-up mode is on and flight crew presses the GLS ◁ STBY NAV key, the ACTIVE window displays the GLS frequency/channel to which that receiver is tuned. The green monitor light on the selected key comes on, and the one on the previously selected STBY NAV key or COM key goes out.

When the radio navigation back-up mode is on and flight crew presses the MLS ◁ STBY NAV key, the ACTIVE window displays the MLS frequency/channel to which that receiver is tuned. The green monitor light on the selected key comes on, and the one on the previously selected STBY NAV key or COM key goes out.

When the radio navigation back-up mode is on and flight crew presses the ADF ◁ STBY NAV key, the ACTIVE window displays the ADF frequency/channel to which that receiver is tuned. The green monitor light on the selected key comes on, and the one on the previously selected STBY NAV key or COM key goes out.

STBY NAV KEYS

When the NAV key is on and the flight crew presses one of these STBY NAV keys, the ACTIVE window displays the frequency/channel to which that receiver is tuned. The green monitor light on the selected key comes on, and the one on the previously selected STBY NAV or COM key goes out.

FREQUENCY/CHANNEL SELECTOR KNOBS

Two concentric knobs allow the flight crew to preselect frequencies/channel for communication radios and stand-by navigation systems and select courses for VOR, ILS, GLS ◁ and MLS ◁ .
The desired frequency, channel or course is set in STBY/CRS window.
The outer and the inner knobs set a frequency/channel: the outer knob is for units, the inner knob is for decimals. The rate multiplier speeds up the tuning when the knob is rotated quickly.
Only outer knob can set a course.

AM PUSHBUTTON

If the aircraft has HF radios and the flight crew has selected an HF tranceiver, this switch selects the AM mode. (The default mode is the SB, or single side-band mode). This key displays a green monitor light when the AM mode is active.

SEL INDICATOR

The SEL indicator on both RMPs comes on amber when a transceiver normally associated with one RMP is tuned by another:

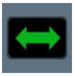
- VHF 1 tuned by RMP 2 or RMP 3,
- VHF 2 tuned by RMP 1 or RMP 3,
- VHF 3, HF 1, HF 2 (◁) tuned by RMP 1 or RMP 2.

RADIO COM SELECTION KEYS

When the pilot presses on these keys:

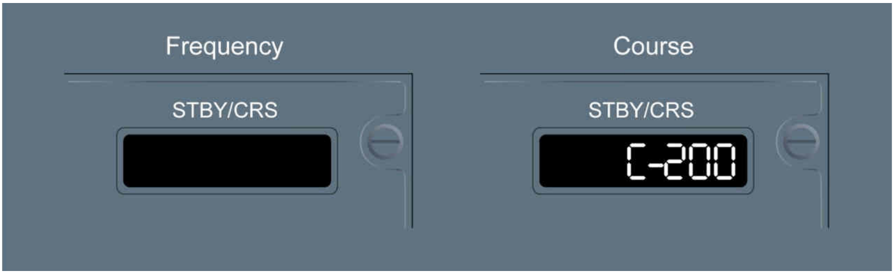
- The ACTIVE window displays the frequency set on that radio.
- The STBY/CRS window displays the selected standby frequency or course.
- The selected key displays a green monitor light.

TRANSFER KEY



The flight crew presses this key to interchange ACTIVE and STBY frequencies/channels. This action tunes the selected receiver to the new ACTIVE frequency/channel.

FREQUENCY DISPLAY (STBY/CRS WINDOW)



The flight crew can change the displayed frequency/channel by rotating the tuning knobs. The frequency/channel displayed in this window becomes the active frequency/channel when the flight crew presses the Transfer Key. If this window displays a course. then the ACTIVE window displays the associated frequency/channel.

Note: *If the STBY/CRS wnidow is displaying a course, then pressing the transfer key displays the active frequency/channel in both windows.*

FREQUENCY DISPLAY (ACTIVE WINDOW)

The ACTIVE display window shows the active frequency/channel of the selected navaid, which is identified by a green monitor light on the selection key.

LOAD FUNCTION

The flight crew can load the VHF frequency from the CPDLC CONTACT/MONITOR messages to the STBY/CRS window.

BFO KEY ◁

If the ADF ◁ is selected, pressing this key activates the BFO (Beat Frequency Oscillator). For most ADF, with BFO activated, the audio identification is heard. However there are some ADF where the BFO must be deactivated in order to hear the audio identification.

Intentionally left blank

GENERAL

Ident.: DSC-34-10-40-10-00019239.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has two radio altimeter (RA).
CAPT PFD displays the RA1 height, and the F/O PFD displays the RA2 height.
If one RA fails, both PFDs display the height from the remaining RA.
For indication on the PFD, *Refer to DSC-31-40 Altitude - Metric Altitude Indications (Cont'd)*.

AUTOMATIC CALLOUT

Ident.: DSC-34-10-40-10-00019240.0001001 / 20 MAR 17
Applicable to: ALL

GENERAL

The FWC generates a synthetic voice for radio height announcement below 2 500 ft. These announcements come through the cockpit loudspeakers, even if the speakers are turned off.

PREDETERMINED CALLOUT

The altitude callout uses the following predetermined threshold:

height (ft)	callout
2 500	TWO THOUSAND FIVE HUNDRED or TWENTY FIVE HUNDRED
2 000	TWO THOUSAND
1 000	ONE THOUSAND
500	FIVE HUNDRED
400	FOUR HUNDRED
300	THREE HUNDRED
200	TWO HUNDRED
100	ONE HUNDRED
80	EIGHTY
70	SEVENTY
60	SIXTY
50	FIFTY
40	FORTY
30	THIRTY
20	TWENTY
10	TEN
5	FIVE
DH (or MDA/MDH) +100	HUNDRED ABOVE
DH (or MDA/MDH)	MINIMUM

Note: *The reference altitude for callouts is the radio height for precision approaches (DH) and baro altitude (MDA/MDH) for non precision approaches.*

Pin programming enables Operators to select the required callouts.
If the aircraft remains at a height that is in the detection zone for a height callout, the corresponding message is repeated at regular intervals.

INTERMEDIATE CALLOUT

If the time between two consecutive predetermined callouts exceeds a certain threshold, the present height is repeated at regular intervals.

The threshold is:
- 11 s above 50 ft, or
- 4 s below 50 ft

The repeating interval is 4 s.

RETARD ANNOUNCEMENT

The loudspeaker announces RETARD:
- at 20 ft, or
- at 10 ft if the autothrust is active and one autopilot is in LAND mode.

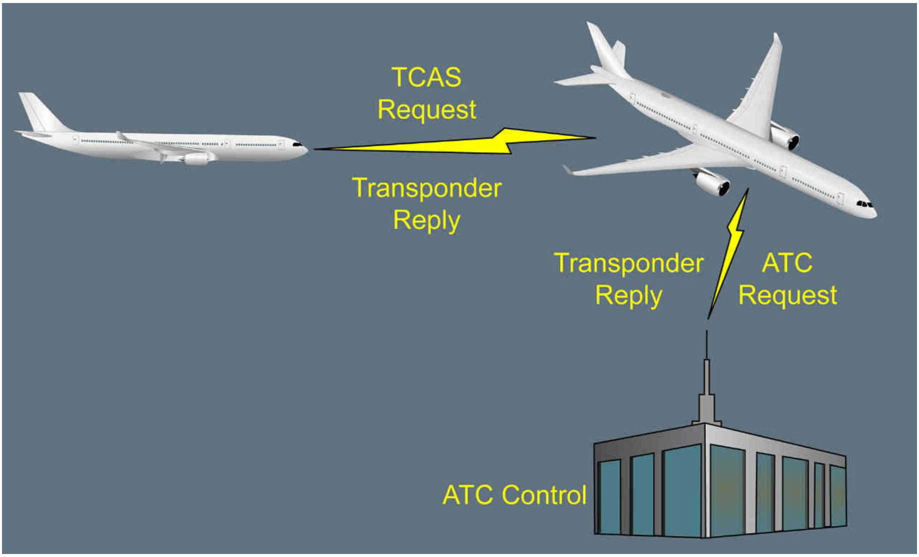
PRINCIPLE

Ident.: DSC-34-20-10-10-00020405.0002001 / 17 MAR 17
Applicable to: ALL

The aircraft has two ATC transponders (XPDR) which are controlled by a control panel (ATC/TCAS) on the center pedestal.
Only the selected XPDR operates.

The XPDR automatically responds to requests:
- From the ATC, to ensure effective air traffic surveillance
- From another aircraft that have a TCAS, to ensure that traffic alerts are triggered.



The XPDR is capable of elementary surveillance (ELS) and enhanced surveillance (EHS). It transmits the following data to the ATC center:
- The aircraft 24 bit address, the aircraft altitude, the flight number, the RA report
- The indicated airspeed, the Mach number, and the barometric vertical speed that are all supplied by the ADRs
- The magnetic heading, the roll angle, the ground speed, the track angle, the track angle rate, and the inertial vertical speed, that are all supplied by the IRs
- The selected altitude and barometric reference settings supplied by the FCUs.

ADS-B OUT

Ident.: DSC-34-20-10-10-00020406.0002001 / 22 MAR 17
Applicable to: ALL

With the ADS-B OUT capability, the Mode S transponders automatically and continuously transmit surveillance data, without preliminary interrogation, to:
- The ATC ground station
- Aircraft capable of ADS-B IN function.

The ADS-B OUT surveillance data that are automatically and continuously transmitted, include the following:
- The latitude and longitude, the Horizontal Integrity Limit (HIL), the difference between barometric altitude and geometric altitude, the ground speed, all supplied by GPS
- The barometric altitude supplied by ADIRS
- The track, the vertical speed, all supplied by the IRs
- The flight number (registered on the ATC flight plan and entered in the FMS during cockpit preparation) supplied by the FMS
- The emergency situation indicator
- The selected altitude and heading, the barometric pressure setting (QNH/QFE) from FCU.

CONTROL PANEL

MEMO DISPLAY

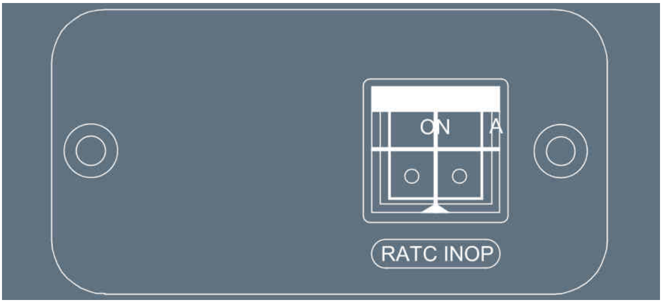
Ident.: DSC-34-20-10-20-00017201.0003001 / 21 MAR 16
Applicable to: ALL

TCAS STBY	This memo appears in amber in flight phase 6 when the ATC/XPDR used by the TCAS is faulty.
TCAS STBY	This memo appears in green in flight phases 2 and 7 when the ATC/XPDR used by the TCAS is faulty.

REMOTE ATC BOX

Ident.: DSC-34-20-10-30-00008512.0003001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

This control panel enabled the crew to easily and rapidly inform the ATC of a hijacking situation.
When one of the two pushbuttons was pressed, Transponder 1 emitted the Hijacking code (7500), via the remote ATC box that was powered by a secured power source.
This function is now deactivated.



Intentionally left blank

DESCRIPTION

Ident.: DSC-34-20-30-10-00014718.0004001 / 17 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

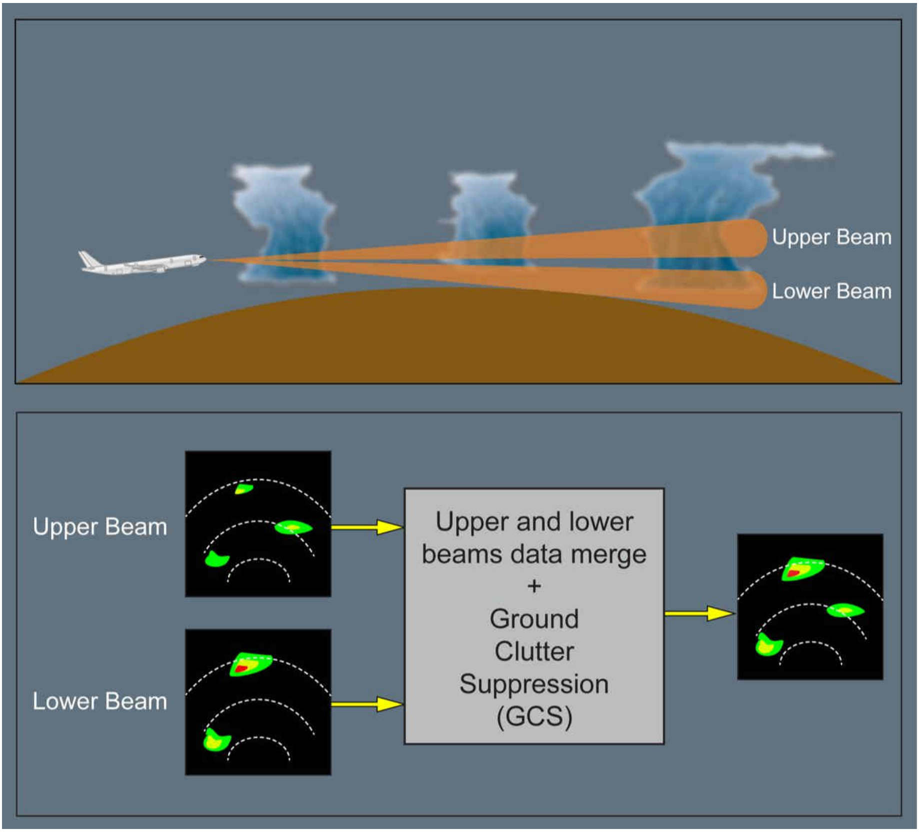
The aircraft is fitted with two Multiscan weather radar systems with a Predictive WindShear (PWS) function ◁ and a weather hazard prediction function ◁ .
The flight crew can display weather data on the CAPT and/or F/O NDs in either ARC or ROSE mode.
The flight crew can adjust the brightness of the weather image on the ND by rotating the outer knob of the ND Brightness Control knob (*Refer to DSC-31-50 EFIS DMC Panel*).

Note: *A low brightness setting of the weather display may reduce the visibility of weather data, and therefore reduce crew awareness of the weather situation.*

The flight crew can use the radar in the following modes:
- Multiscan Automatic mode: MULTISCAN sw set to AUTO (recommended), or
- Manual mode: MULTISCAN sw set to MAN.

When in Multiscan Automatic mode:
- The radar alternatively scans at two antenna tilt settings. The weather radar image that is displayed is the result of the stored and combined information from each beam.
- When the gain selector is set to the Calibrated position (CAL), the radar automatically adjusts the gain based on various parameters (aircraft altitude, geographical area, season, time of the day) to obtain the best weather display.
- To prevent unnecessary clutter display, the “Quiet and Dark cockpit” philosophy removes the weather that:
  - is not on the aircraft flight path
  - is not a threat to the aircraft (post convective cell).
- The Ground Clutter Suppression (GCS) function removes the ground returns from the ND.

Multiscan Principle



Upper Beam
Lower Beam
Upper Beam
Lower Beam
Upper and lower beams data merge
+
Ground Clutter Suppression (GCS)

When in Manual mode:

- The flight crew can adjust manually the antenna tilt settings, and can adjust gain either automatically or manually using knobs located on the radar control panel
- The GCS function is not available
- When the gain selector is set to CAL, there is no automatic gain adjustment based on altitude, geographical area, season and time of the day.

As a consequence, when the flight crew switches from the Multiscan Automatic mode with CAL gain to the Manual mode with CAL gain, the weather displayed on the ND may be significantly different.

DESCRIPTION

Ident.: DSC-34-20-30-10-00014718.0003001 / 17 MAY 21
Applicable to: LV-KHT, LV-KHU

The aircraft is fitted with two Autotilt weather radar systems with a Predictive WindShear (PWS) function ◁ .
The flight crew can display weather data on the CAPT and/or F/O NDs in either ARC or ROSE mode.
The flight crew can adjust the brightness of the weather image on the ND by rotating the outer knob of the ND Brightness Control knob (*Refer to DSC-31–50 EFIS DMC Panel*).

Note: *A low brightness setting of the weather display may reduce the visibility of weather data, and therefore reduce crew awareness of the weather situation.*

The flight crew can use the radar in either Autotilt (automatic) mode (recommended setting) or in Manual mode.

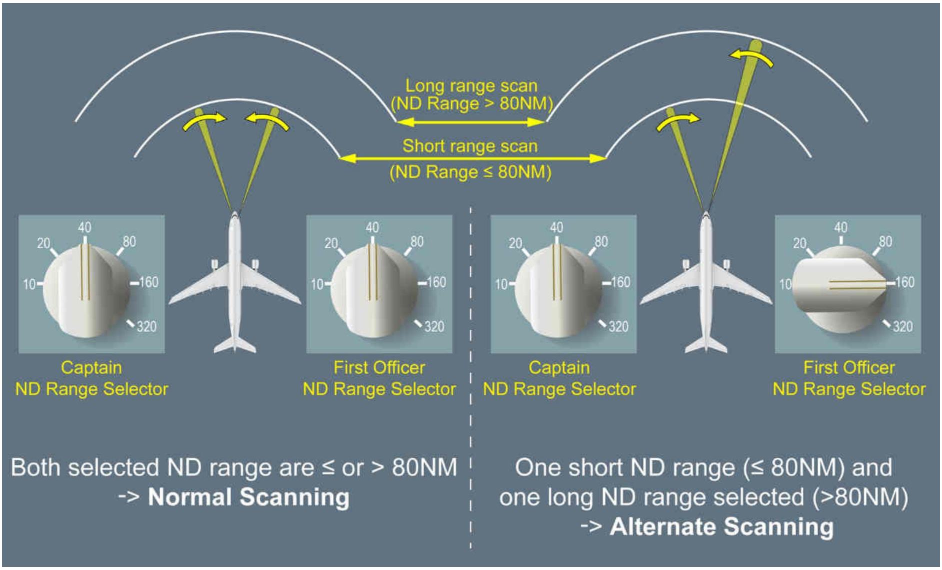
When in Autotilt mode:
- Using the EGPWS terrain database, the radar automatically adjusts the antenna tilt based on aircraft position, altitude, and the selected ND range
- Autotilt optimizes detection and display of weather based on aircraft flight phase, and reduces ground clutter
- Depending on the selected ND range and aircraft altitude, Autotilt optimizes the tilt for either short range or long range detection:

Selected ND range	10 NM	20 NM	40 NM	80 NM	160 NM	320 NM
Above 2 300 ft AGL	Tilt adjustment for short range detection				Tilt adjustment for long range detection	
Below 2 300 ft AGL	Tilt adjustment for short range detection + PWS scanning					

- When two different ranges are selected on CAPT and F/O ND, the radar scans alternatively at two different tilt settings. Each of these tilt setting is optimized for the selected range. This alternate scanning reduces the refresh rate of each ND image.

Note: Below 2 300 ft, PWS (if installed) scanning is active, alternate scanning is disabled.

Alternate scanning of the Autotilt according to ND range selection (above 2 300 ft)



Long range scan
(ND Range > 80NM)

Both selected ND range are ≤ or > 80NM
-> **Normal Scanning**
One short ND range (≤ 80NM) and
one long ND range selected (>80NM)
-> **Alternate Scanning**

- On the ground, Autotilt adjusts the tilt to provide optimum detection of weather at 10 000 ft above ground level
- The flight crew can use either automatic gain (recommended default position) or manual gain for weather analysis.

When in Manual mode:
- The flight crew adjusts the antenna tilt settings manually
- The flight crew adjusts the gain either automatically or manually.

GENERAL

Ident.: DSC-34-20-30-20-00004757.0001001 / 21 MAR 17
Applicable to: LV-KHT, LV-KHU

The weather radar has a Predictive Windshear System (PWS) that operates when:
- The PWS sw is in the AUTO position (Even if the weather radar is OFF), and
- The aircraft is below 2 300 ft AGL, and
- The ATC is switched to the ON or AUTO position (or XPNDR ◁), and
- One engine is running.

Note: *When the selected weather radar fails, the flight crew can recover the PWS function by selecting the operative system on the radar control panel.*

The system scans the airspace for windshear within a range of 5 NM ahead of the aircraft.
When the system detects windshear, and depending on the range selected on the ND, a warning, caution or advisory message appears on the ND. Predictive windshear warnings and cautions are associated with an aural warning.
Predictive windshear warnings and cautions are associated to an aural alert and to a red (warning) or amber (caution) "W/S AHEAD" message on the PFD, whereas windshear advisories are only displayed on the ND (*Refer to DSC-34-20-30-30 PWS indication on PFD and ND*) without message on the PFD.

Alert Level	**Aural Warning**	**PFD**	**ND (*Refer to DSC-34-20-30-30 PWS indication on PFD and ND*)**
Warning (Approach)	«GO AROUND WINDSHEAR AHEAD»	W/S AHEAD (red)	Windshear icon
Warning (Takeoff)	«WINDSHEAR AHEAD» (twice)	W/S AHEAD (red)	Windshear icon
Caution	«MONITOR RADAR DISPLAY»	W/S AHEAD (amber)	Windshear icon
Advisory	Nil	Nil	Windshear icon

Ident.: DSC-34-20-30-20-00004757.0003001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The weather radar has a Predictive WindShear System (PWS) that operates when the PWS sw is in the AUTO position, and the aircraft radio height is below 2 300 ft, and
- Weather radar is ON (Radar sw on position 1 or 2), or
- Weather radar is OFF, and
  - At least one engine is running, and
  - Aircraft ground speed is greater than 30 kt, or
  - Aircraft longitudinal acceleration is above a given threshold during at least 0.5 s

Note: *When the selected weather radar fails, the flight crew can recover the PWS function by selecting the operative system on the Radar sw of the radar control panel.*

The system scans the airspace for windshear within a range of 5 NM ahead of the aircraft. When the system detects windshear, a windshear symbol appears on the ND (*Refer to DSC-34-20-30-30 PWS indication on PFD and ND*).
Predictive windshear warnings and cautions are associated to an aural alert and to a red (warning) or amber (caution) "W/S AHEAD" message on the PFD, whereas windshear advisories are only displayed on the ND (*Refer to DSC-34-20-30-30 PWS indication on PFD and ND*) without message on the PFD.

Alert Level	**Aural Warning**	**PFD**	**ND (*Refer to DSC-34-20-30-30 PWS indication on PFD and ND*)**
Warning (Approach)	«GO AROUND WINDSHEAR AHEAD»	W/S AHEAD (red)	Windshear icon
Warning (Takeoff)	«WINDSHEAR AHEAD» (twice)	W/S AHEAD (red)	Windshear icon
Caution	«MONITOR RADAR DISPLAY»	W/S AHEAD (amber)	Windshear icon
Advisory	Nil	Nil	Windshear icon

WINDSHEAR ALERTS INHIBITION

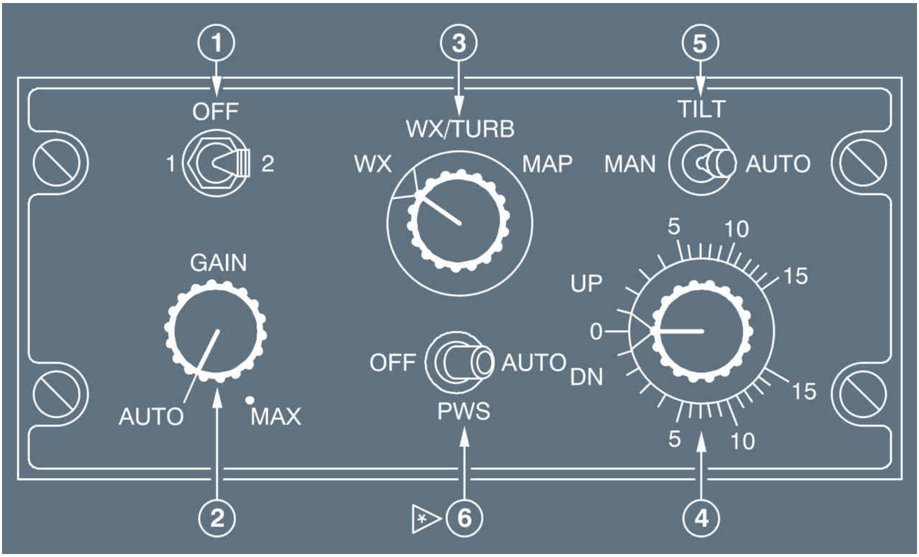
Ident.: DSC-34-20-30-20-00004760.0001001 / 14 OCT 15
Applicable to: ALL

At takeoff, alerts are inhibited above 100 kt and up to 50 ft.
During landing, alerts are inhibited below 50 ft.

The aural alerts of the Predictive WindShear System (PWS):
- Have priority over TCAS, GPWS and other FWC aural warnings
- Are inhibited by reactive windshear detection and aural messages of stall warnings.

CONTROL PANEL

Ident.: DSC-34-20-30-30-00014713.0004001 / 13 JAN 14
Applicable to: LV-KHT, LV-KHU



(1) Radar sw
This switch sets one radar to ON or turns off both radars.

(2) GAIN knob
This knob adjusts the sensitivity of the radar.
“AUTO” is the normal position; it adjusts the gain to a calibrated setting.

(3) Display Mode selector

WX : Weather mode:
Colors indicate the intensity of precipitation (black for the lowest intensity, green, amber and red indicate progressively higher intensities).

WX/TURB ◁* Weather and Turbulence mode:
The ND indicates precipitation and turbulence areas. Turbulence areas are displayed in magenta (within 40 NM).

MAP : Map mode:
The radar operates in ground mapping mode: Black indicates water, green indicates the ground, and amber indicates cities and mountains.

(4) TILT knob

The TILT knob adjusts antenna tilt above and below the horizon.
Zero indicates the horizon reference, as provided by the ADIRS.

(5) TILT Mode sw

AUTO : Automatically selects tilt to optimize weather detection and minimize ground clutter.

MAN : When set to MAN, the crew can then manually adjust the tilt by using the TILT knob.

(6) PWS sw

AUTO : Activates the predictive windshear function.
Windshear areas can be detected when radio height is below 1 500 ft, even if the Radar sw is set to off.

OFF : Turns off the predictive windshear function.

CONTROL PANEL

(1) Radar sw
This switch sets one radar to ON or turns both radars to OFF.

(2) GAIN knob
This knob adjusts the sensitivity of the radar.

CAL is the normal position of the knob
- When in Multiscan Automatic mode and gain set to CAL, the radar automatically adjusts the gain according to various parameters (aircraft altitude, geographical area, season, time of the day) to obtain the best weather display.
- When in Manual mode and gain set to CAL, the radar adjusts the gain to a calibrated setting.

(3) Display Mode selector

WX : Weather mode:
Colors indicate the intensity of precipitation (black for the lowest intensity, green, amber and red indicate progressively higher intensity).

WX+T : Weather and Turbulence mode:
The ND indicates precipitation and turbulence areas. Turbulence areas are displayed in magenta (within 40 NM).

TURB ◁ : Turbulence mode:
The ND only displays turbulence areas. Turbulence areas are displayed in magenta (within 40 NM).

WX+T +HZD ◁ : Weather, Turbulence and Hazard mode (recommended position) :
The ND indicates precipitation, turbulence areas in magenta (within 40 NM) and hazard prediction risk areas.
Hazard prediction function is only available when the MULTISCAN sw is set to AUTO.

Note: When MULTISCAN sw is set to MAN, WX+T+HZD mode is equivalent to WX+T mode.

MAP : Map mode:
The radar operates in ground mapping mode: black indicates water, green indicates the ground, and amber indicates cities and mountains.

(4) TILT knob

This knob adjusts the antenna tilt when MULTISCAN sw is set to MAN.
Zero indicates the horizon reference, as provided by the IRS.

(5) MULTISCAN sw

AUTO : Activates Multiscan mode.
Multiscan controls the tilt automatically and combines two scans done at different tilt angles to optimize weather detection and minimize ground clutter.

MAN : When set to MAN, the crew can manually adjust the tilt by using the TILT knob.

(6) GCS sw

The Ground Clutter Suppression (GCS) switch is spring-loaded to the AUTO position.

AUTO :
- If MULTISCAN sw is set to AUTO, the radar is in normal use. Ground clutter is not displayed on the screen
- If MULTISCAN sw is set to MAN, the GCS sw has no utility. Ground clutter is displayed on the screen.

OFF : Ground clutter is displayed on the screen.

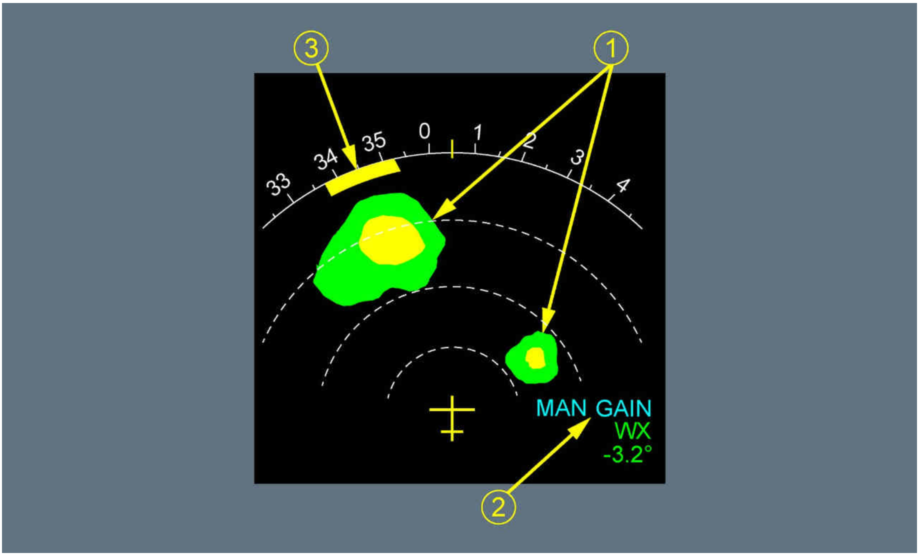
(7) PWS sw

AUTO : Activates the Predictive WindShear function in accordance with activation conditions.

OFF : The Predictive WindShear function is off.

WEATHER RADAR INDICATION ON ND

Ident.: DSC-34-20-30-30-00000745.0014001 / 03 MAY 23
Applicable to: LV-GIF



(1) Weather Radar Picture

- When the radar is operating, and when the ND is not in PLAN mode, the ND displays the weather radar picture.
- The weather echoes appear in different colors, depending on the precipitation rates (black, green, yellow, red or magenta for turbulence).
- The selected ND range will determine how often the image is refreshed.

(2) Weather Radar Indication

- 1st row: Gain Mode
  MAN GAIN appears when the flight crew selects the manual gain mode.
- 2nd row: Active Detection Modes
  The active detection modes appear in:

  - Blue when the MULTISCAN sw is on the MAN position, or
  - Green when the MULTISCAN sw is on the AUTO position.

  The active detection modes can be one of the following:
  - WX
  - WX+T
  - TURB ◁
  - PWS SCAN (when PWS function is active)
  - MAP
  - WX+T+H ◁
  - WXR OFF

  Note: Except for PWS SCAN and WXR OFF, the active detection modes are displayed:

  - *In cyan if manual mode is selected*
  - *In green if automatic mode is selected*

- 3rd row: Tilt Angle
  The multiscan function of the weather radar alternatively scans at low and high beam, and automatically sets the tilt of these beams to optimize the weather radar detection. The displayed weather radar picture is the result of the storing and merging of the information from each beam.
  The tilt angle is the angle between the horizon and the radar beam axis. The value of the tilt angle is in degrees, and quarters of a degree. It is displayed:
  - In green, when the MULTISCAN sw is set to AUTO. This value represents the average of the lower and the upper beam tilts
  - In cyan, next to the MAN indication, when the flight crew sets the MULTISCAN sw to MAN.

  When the multiscan function is lost, the tilt value is dashed and the NO AUTO TILT message appears on the ND, until the flight crew sets the MULTISCAN sw to MAN.
- 4th row: Failure Messages
  The ND lists the detected failures.
  If the message is in red, the ND does not display the radar image.
  If the message is in amber, the image is not affected.

NO WXR	:	Radar display failure
WXR RT	:	Radar transceiver failure
WXR ANT	:	Radar antenna failure.
WXR CTL	:	Radar control unit failure.
WXR RNG	:	Range error.
WXR DU	:	Overheating of the display unit.
WXR WEAK	:	Calibration failure.
WXR ATT	:	Attitude control failure.
WXR STAB	:	Antenna stabilization failure.
PRED W/S	:	PWS function ◁ failure.
NO AUTO TILT	:	Automatic tilt adjustment failure.
WXR TEST	:	Radar System test.

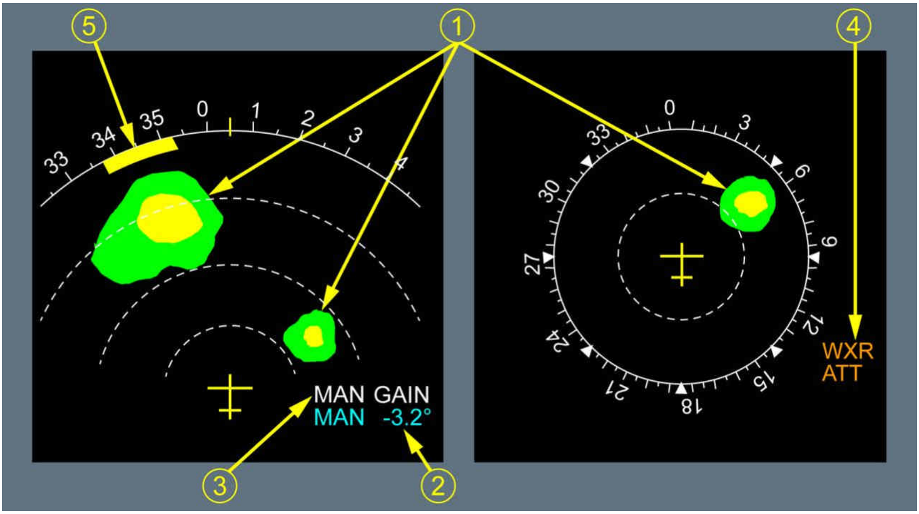
(3) PAC Alert

When the flight crew sets the display mode selector to WX or WX+T, or WX+T+HZD ◁ and sets the gain to CAL, and when the aircraft is within 80 NM of a storm cell, the PAC alert is available.
The PAC alert displays a yellow arc on the outermost scale of the ND, when an intervening rainfall creates an attenuated area behind a storm cell (also called a radar shadow or attenuation effect).

Note: *The PAC alert is available regardless of the position of the MULTISCAN sw (e.g. MAN or AUTO).*

WEATHER RADAR INDICATION ON ND

Ident.: DSC-34-20-30-30-00000745.0006001 / 03 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GKO, LV-GKP, LV-KAN, LV-KAO



(1) Weather Radar Picture

- When the radar is operating, and when the ND is not in PLAN mode, the ND displays the weather radar picture.
- The weather echoes appear in different colors, depending on the precipitation rates (black, green, yellow, red or magenta for turbulence).
- The selected ND range will determine how often the image is refreshed.

(2) Tilt Angle

- The multiscan function of the weather radar alternatively scans at low and high beam, and automatically sets the tilt of these beams to optimize the weather radar detection. The displayed weather radar picture is the result of the storing and merging of the information from each beam.
- The value of the tilt angle is in degrees, and quarters of a degree. It appears in the lower right corner of the screen:
  - In green, when the MULTISCAN sw is set to AUTO. This value represents the average of the lower and the upper beam tilts.
  - In blue, next to the MAN indication, when the flight crew sets the MULTISCAN sw to MAN.

  The tilt angle is the angle between the horizon and the radar beam axis.
- When the multiscan function is lost, the tilt value is dashed and the NO AUTO TILT message appears on the ND, until the flight crew sets MULTISCAN sw to MAN.

(3) Gain Mode

- MAN GAIN appears, when the flight crew selects the manual gain mode.

(4) Failure Messages

The ND lists the detected failures.
If the message is in red, the ND does not display a radar image.
If the message is in amber, the image is not affected.

NO WXR : Radar System failure.
WXR RT : Radar transceiver failure.
WXR ANT : Radar antenna failure.
WXR CTL : Radar control unit failure.
WXR RNG : Range error.
WXR DU : Overheating of the display unit.
WXR WEAK : Calibration failure.
WXR ATT : Attitude control failure.
WXR STAB : Antenna stabilization failure.
PRED W/S : PWS function ◁ failure.
NO AUTO TILT : Automatic tilt adjustment failure.
WXR TEST : Radar System test.

(5) PAC alert

When the flight crew sets the display mode selector to WX or WX+T, or WX+T+HZD ◁ and sets the gain to CAL, and when the aircraft is within 80 NM of a storm cell, the PAC alert is available.

The PAC alert displays a yellow arc on the outermost scale of the ND, when an intervening rainfall creates an attenuated area behind a storm cell (also called a radar shadow or attenuation effect).

Note: *The PAC alert is available regardless of the position of the MULTISCAN sw (e.g. MAN or AUTO).*

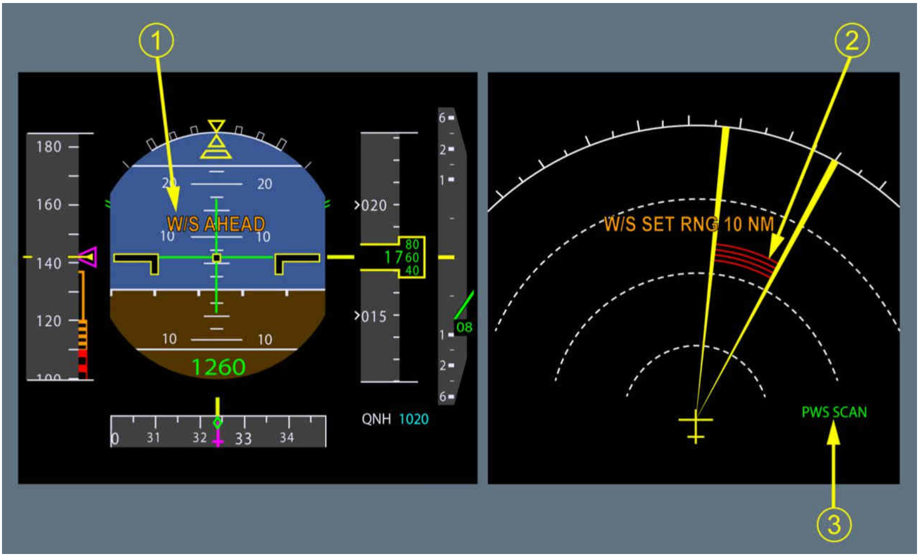
PWS ⋘ INDICATION ON PFD AND ND

Ident.: DSC-34-20-30-30-00020809.0002001 / 01 MAR 18
Applicable to: ALL



(1) W/S AHEAD message on the PFD
This message is displayed, when the Predictive WindShear system detects windshear ahead of the aircraft..
The message is in amber or red, depending on the level of the alert.

(2) Predictive WindShear area indication
A red and black symbol and two yellow radial lines indicate the predicted windshear area.
Windshear indication is available in ARC and ROSE ND modes.
When the radar detects a windshear event and the ND range is set above 10 NM, a W/S SET RNG 10 NM (Windshear, set range to 10 NM) message appears. This message requests the flight crew to adjust the range on the corresponding ND.
Depending on the windshear alert level, ND indication may be associated with an aural message and a PFD message.

(3) PWS SCAN message on the ND

If only the PWS detection is active, the ND displays a PWS SCAN message when the PWS is active. In this mode, when the radar detects a windshear event, a windshear symbol and the weather returns appear automatically on the ND.

MEMO DISPLAY

Ident.: DSC-34-20-30-30-00017202.0001001 / 21 MAR 16
Applicable to: ALL

The "PRED W/S OFF" message appears when the windshear is set to OFF on the weather radar panel.

PRED W/S OFF	:	This memo appears in green during flight phases 2 and 6.
PRED W/S OFF	:	This memo appears in amber when: - The aircraft is in flight phases 3, 4, 5, 7, 8, and 9. - The T.O. CONFIG pb is pressed during flight phase 2.

OVERVIEW

Ident.: DSC-34-20-40-10-00021038.0001001 / 17 MAR 17
Applicable to: ALL

The purpose of the Ground Proximity Warning System (GPWS) is to warn the flight crew of potentially hazardous situations, such as a collision with terrain. It detects terrain collision threats and triggers applicable aural and visual indications.

The GPWS includes:

- Five basic modes active up to radio height of 2 500 ft:
  - Excessive rate of descent (Mode 1)
  - Excessive terrain closure rate (Mode 2)
  - Altitude loss after takeoff or go-around (Mode 3)
  - Terrain clearance not sufficient, if not in landing configuration (Mode 4)
  - Excessive descent below the glide slope (Mode 5).
- A predictive GPWS function, based on a GPWS database, to display terrain information. It can be provided:
  - By Honeywell through Enhanced GPWS (EGPWS)
  - By ACSS as Ground Collision Avoidance System (GCAS), through T2CAS or T3CAS.

  The predictive GPWS is composed of:

  - Mandatory functions such as the Forward Looking Terrain Alerting function
  - Optional functions such as the obstacle database.

  Note: *The terrain data are displayed on the ND and the brightness is controlled via the weather radar brightness control knob. If the weather radar brightness was set to low (due to bad weather) and a terrain alert occurs, then the brightness of the terrain display will also be low.*

PRINCIPLE

Ident.: DSC-34-20-40-10-00021039.0001001 / 17 MAR 17
Applicable to: ALL

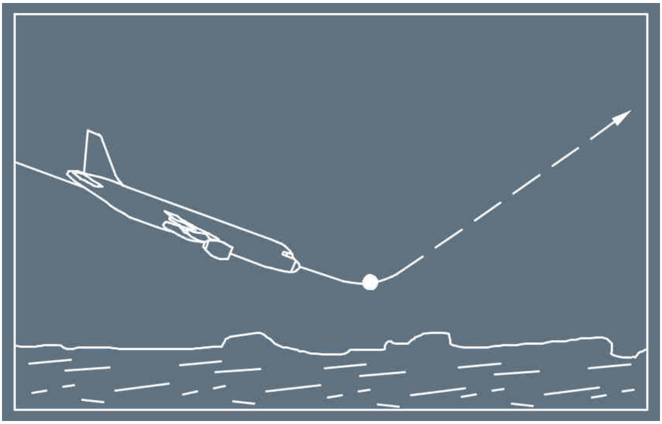
The GPWS computes the geometric altitude of the aircraft by using:

- Pressure altitude
- Radio-altitude
- Temperature
- Barometric references

- GPS altitude for predictive GPWS ◁
- Data from the GPWS database for predictive GPWS ◁ .

MODE 1 : EXCESSIVE RATE OF DESCENT

Ident.: DSC-34-20-40-20-00014903.0004001 / 19 MAY 14
Applicable to: ALL

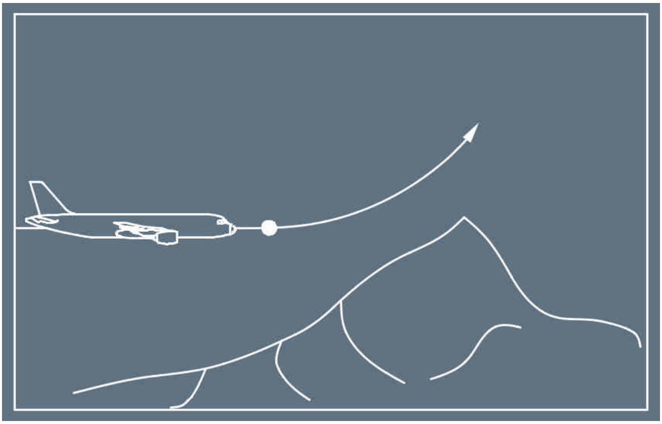


Mode 1 triggers aural and visual alerts about excessive rates of descent, based on the radio height, and the rate of descent of the aircraft.
Mode 1 is active for all phases of the flight.

	CAUTION		WARNING	
AURAL ALERT	"SINK RATE, SINK RATE"		"PULL UP" (repeated as long as MODE 1 is triggered)	
VISUAL ALERT	GPWS	The GPWS amber lights come on	PULL UP	The PULL UP red lights come on

MODE 2 : EXCESSIVE TERRAIN CLOSURE RATE

Ident.: DSC-34-20-40-20-00014904.0004001 / 03 AUG 17
Applicable to: ALL



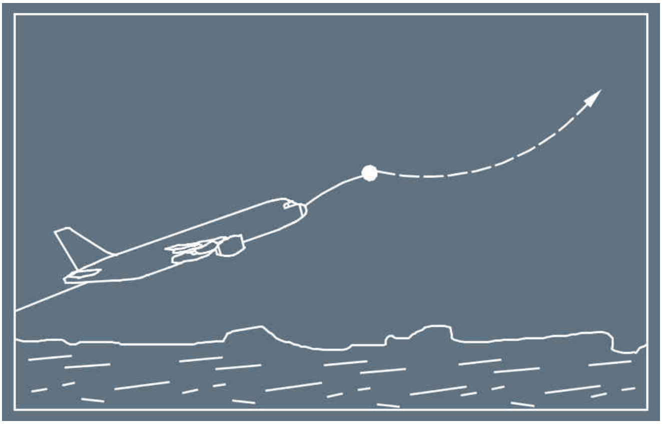
Mode 2 triggers aural and visual alerts, based on the landing gear/flaps configuration of the aircraft, the radio height, and the RA rate of change.
There are two types of Mode 2 alerts, Mode 2A (active during climb, cruise, and initial approach), and Mode 2B (active during approach and 60 s after takeoff).

CONFIGURATION	**Flaps not in Landing position + Landing Gear Up (Mode 2A)** **Flaps in landing position + Landing Gear Up (Mode 2B)**					
	CAUTION		**WARNING**			
AURAL ALERT	"TERRAIN, TERRAIN"		"PULL UP" (repeated as long as MODE 2 is triggered in the warning conditions)		"TERRAIN" (repeated as long as MODE 2 is triggered after leaving the warning conditions)	
VISUAL ALERT	GPWS	The GPWS amber lights come on	PULL UP	The PULL UP red lights come on	PULL UP	The PULL UP red lights stay on

CONFIGURATION	**Flaps in landing position + Landing Gear Down (Mode 2B)**
AURAL ALERT	**CAUTION** "TERRAIN" (repeated as long as MODE 2 is triggered)
VISUAL ALERT	GPWS The GPWS amber lights come on

MODE 3 : ALTITUDE LOSS AFTER TAKEOFF

Ident.: DSC-34-20-40-20-00014905.0004001 / 20 SEP 13
Applicable to: ALL

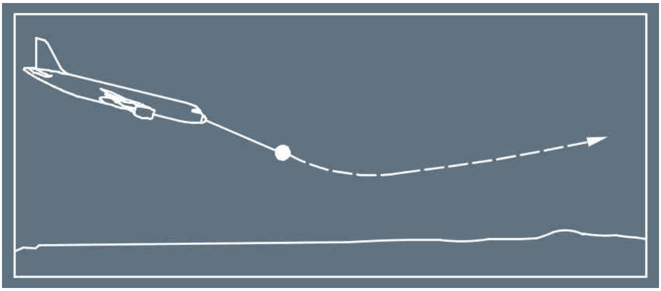


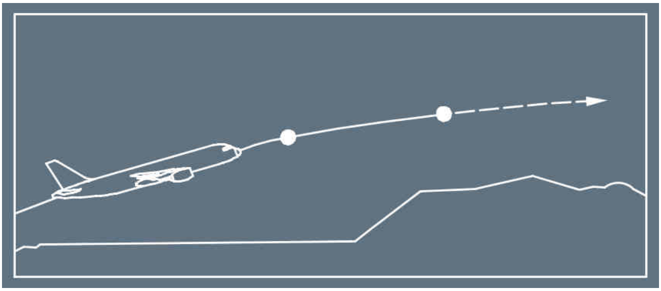
Mode 3 triggers aural and visual alerts when the altitude significantly decreases after takeoff, and go-arounds with landing gear or flaps not in landing configuration.

	CAUTION
AURAL ALERT	"DON'T SINK, DON'T SINK" (repeated as long as MODE 3 is triggered)
VISUAL ALERT	GPWS The GPWS amber lights come on

MODE 4 : UNSAFE TERRAIN CLEARANCE WHEN NOT IN LANDING CONFIGURATION

Ident.: DSC-34-20-40-20-00014906.0003001 / 13 JAN 14
Applicable to: ALL





There are three types of Mode 4 alerts, Mode 4A and Mode 4B (both active during cruise and approach), and Mode 4C (active during takeoff*).
Mode 4A and Mode 4B trigger aural and visual alerts when terrain clearance is not sufficient based on the phase of flight, the configuration of the landing gear and the flaps, and the speed. Mode 4C triggers aural and visual alerts based on the minimum terrain clearance and the radio height of the aircraft. *(Only EGPWS not T2CAS)

<table>
<tr><th>CONFIGURATION</th><th colspan="2">Landing gear Up (Mode 4A)</th><th colspan="2">Flaps not in landing position + Landing gear down (Mode 4B)</th><th>Flaps not in landing position OR Landing Gear Up (Mode 4C)</th></tr>

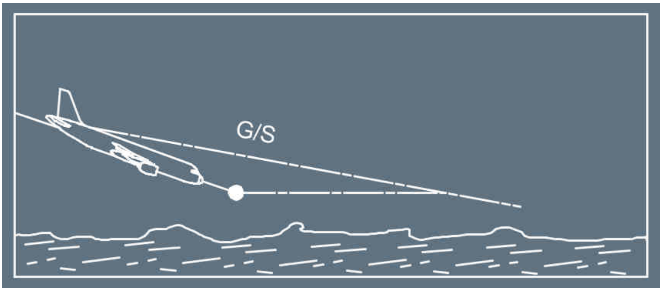
</table>

MODE 5 : DESCENT BELOW GLIDESLOPE

Ident.: DSC-34-20-40-20-00014907.0004001 / 20 SEP 13

Applicable to: ALL



Mode 5 triggers aural and visual alerts, when the aircraft descends below the glide slope.

	CAUTION
AURAL ALERT	"GLIDESLOPE" (repeated as long as MODE 5 is triggered)
VISUAL ALERT	GPWS The GPWS amber lights come on

Intentionally left blank

TERRAIN AWARENESS AND DISPLAY

Ident.: DSC-34-20-40-30-00001218.0010001 / 31 MAR 11
Applicable to: ALL

The Terrain Awareness and Display (TAD) function computes a caution and a warning envelope ahead of the aircraft, depending on the aircraft altitude, the nearest runway altitude, the range to the nearest runway threshold, the ground speed, and the turn rate. When the boundary of these envelopes conflicts with the terrain, or with an obstacle memorized in the database, the system generates the relevant alert:

Alert Level	Aural Warning	ND	Local Warning
Warning	TERRAIN AHEAD, PULL UP	- Automatic terrain display (1) - Solid red areas - TERR AHEAD (red)	On each pilot's instrument panel, the PULL UP (red) light comes on.
	OBSTACLE AHEAD PULL UP	- Automatic terrain display (1) - Solid red areas - OBST AHEAD (red)	
Caution	TERRAIN AHEAD	- Automatic terrain display (1) - Solid yellow areas - TERR AHEAD (amber)	On each pilot's instrument panel, the GPWS (amber) light comes on
	OBSTACLE AHEAD	- Automatic terrain display (1) - Solid yellow areas - OBST AHEAD (amber)	

(1) *When the TERR ON ND pb is set to ON, and ARC or ROSE mode is selected, the ND displays the terrain and the obstacles memorized in the database, depending on the aircraft's position. The terrain is displayed in various densities of green, yellow, red or magenta depending on the threat (Refer to DSC-31-45 General: INDICATIONS ON ND). If an alert is generated (caution or warning) and TERR ON ND is not selected, the terrain is automatically displayed, and the ON light of the TERR ON ND pb comes on.*

Note: *1. When TERR ON ND is selected, the weather radar display image is not displayed.*
2. The Geometric Altitude function can protect against certain BARO setting errors, provided the components used to compute the Geometric Altitude are valid and accurate enough.
3. The TAD and Terrain Clearance Floor (TCF) functions operate using the pure lateral GPS position and, the FMS 1 position as backup.

In case of low accuracy of the aircraft position computed by the EGPWS, the enhanced modes of the EGPWS are automatically deactivated. The five GPWS modes remain active.

Applicable to: ALL

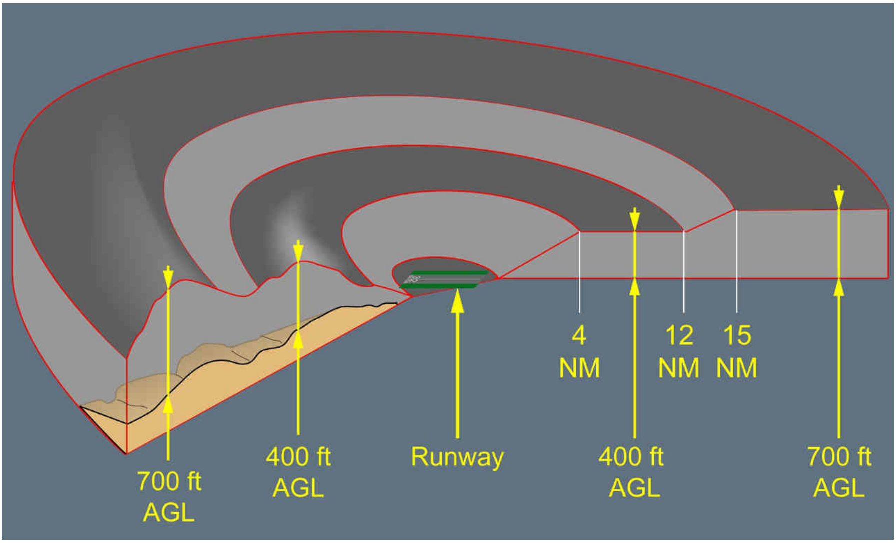
TERRAIN CLEARANCE FLOOR (TCF)

The TCF function computes a terrain clearance envelope around the airport runway. This function triggers an alert if the terrain clearance is not sufficient (even when the aircraft is in landing configuration). This function provides an enhanced GPWS mode 4.
The TCF function also protects against an attempt to land where there is no airfield.
The TAWS database includes the applicable TCF envelope for each airport runway that has terrain data, and that is longer than 3 500 ft.
The TCF function is active during all the following flight phases: Takeoff, cruise and approach.

TCF Envelope



If the aircraft descends below the protection envelope, both of the following alerts are triggered:
- The "TOO LOW TERRAIN" aural alert, if the aircraft enters the envelope
  L2 If the aircraft continues to descend below the envelope, the alert is triggered one time for every 20 % degradation in radio altitude
- L1 The GPWS light of the GPWS pb-sw on each instrument panel comes on (*Refer to DSC-34-20-40-40 Main Instruments Panel*).

RUNWAY FIELD CLEARANCE FLOOR

Ident.: DSC-34-20-40-30-00005065.0002001 / 28 MAY 20
Applicable to: ALL

The Runway Field Clearance Floor (RFCF) function provides an additional protection envelope for runways that are at an elevation that is significantly more than the surrounding terrain.
The envelope is a circular band that starts within a specific distance of the runway. The width of this circular band depends on the runway. The envelope is based on both the geometric altitude and the runway elevation.
If the aircraft descends below this protection envelope, the "TOO LOW TERRAIN" aural and visual alerts are triggered.

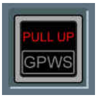
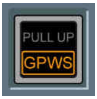
PULL UP – GPWS pb

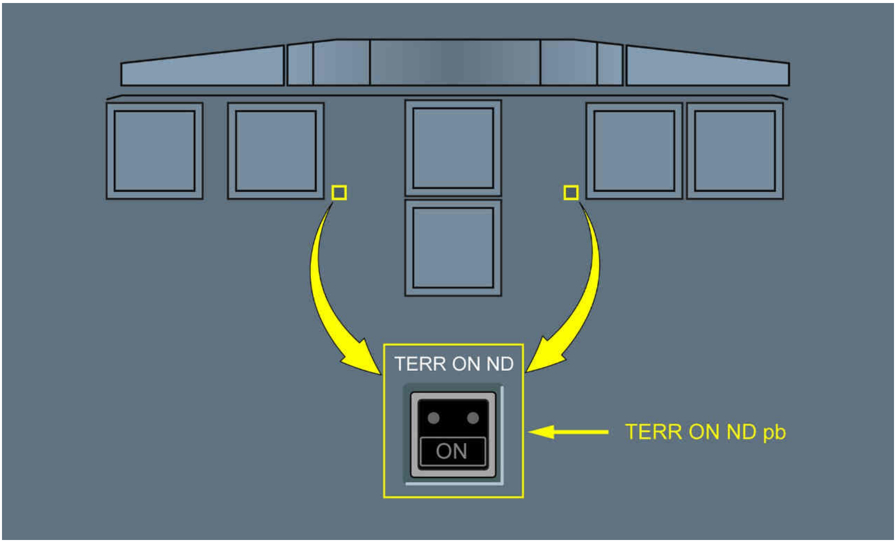


Comes on to give a visual indication when a PULL UP warning alert is triggered in modes 1, 2, and TAD. The corresponding aural alert sounds.



Comes on when any other mode is activated.
The corresponding aural alert sounds.

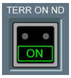
Note:
1. *If the flight crew briefly presses the PULL UP – GPWS pb when the GPWS light is on, following a mode 5 GLIDE SLOPE alert, the GPWS light goes off and the aural alert stops.*
2. *On the ground, to test the GPWS, the flight crew press the PULL UP – GPWS pb. If the flight crew briefly presses this pb, some of the aural alerts sound and the pb captions, associated with the GPWS come on. If the flight crew continuously presses this pb, all the aural alerts sound.*



TERR ON ND
ON
TERR ON ND pb

TERR ON ND pb

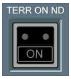
These pbs are on both sides of the ECAM. Each pb controls the onside terrain display.



TERR ON ND
ON

The terrain appears on the ND if both of the following apply:
- TERR ON ND pb is set to ON
- TERR FAULT light is not on.

The ON light comes on.



TERR ON ND
ON

The terrain data does not appear on the ND.

Note:

1. *If the TAD mode generates a caution or a warning while the TERR ON ND pb is off, the terrain automatically appears on the NDs. In addition, the ON light of the TERR ON ND pb will come on.*
2. *To be able to identify the difference between the terrain and the weather display, the terrain display goes from the center outward to both sides of the ND.*
3. *The terrain and obstacles image appears on the ND if:*
   - *The aircraft is within 2 000 ft above the terrain, and*
   - *The TERR ON ND pb is pressed, or automatically, in the case of terrain caution(warning) alerts.*

   Depending on the capacity of the TAWS system installed (e.g. with Eleview or Peaks functions), the terrain can display the highest and lowest geographic terrain elevations for the selected ND range. The terrain can also increase situation awareness, regardless of the aircraft altitude.

   If the terrain(obstacle) image is automatically displayed on the ND, if the flight crew presses the TERR ON ND pb, the terrain(obstacle) image no longer appears.

MEMO DISPLAY

Applicable to: ALL

Ident.: DSC-34-20-40-40-A-00017204.0001001 / 21 MAR 16

GPWS FLP OFF : This memo appears in green when the GPWS FLAP MODE pb-sw is OFF.

Ident.: DSC-34-20-40-40-A-00017205.0002001 / 21 MAR 16

The "TERR OFF" message appears when the EGPWS is voluntarily deselected.

TERR OFF : This memo appears in green during flight phases 2 and 6.

TERR OFF : This memo appears in amber when:

- The aircraft is in flight phases 3, 4, 5, 7, 8, and 9.
- The T.O. CONFIG pbis pressed during flight phase 2.

Ident.: DSC-34-20-40-40-A-00017208.0004001 / 21 MAR 16

TERR STBY : In flight, the TERR STBY memo appears in green when the aircraft position accuracy (computed by the EGPWS) is insufficient to allow the enhanced TCF and TAD modes to operate. These modes are not available until the TERR STBY memo disappears. If selected, the terrain data display on the ND is automatically deselected when the TERR STBY memo is triggered.

Intentionally left blank

GENERAL

Ident.: DSC-34-20-50-10-00016110.0001001 / 23 JUN 15
Applicable to: LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The Runway Overrun Prevention System (ROPS) is designed to alert the flight crew in the case of potential runway overrun situation for dry and wet runway. The ROPS is composed of two functions:
- The Runway Overrun Warning (ROW) function. It automatically arms at 500 ft AGL and works until start of braking,
- The Runway Overrun Protection (ROP) function. It works from start of braking until the aircraft stops.

Intentionally left blank

DESCRIPTION

Ident.: DSC-34-20-50-20-00016112.0004001 / 03 NOV 22
Applicable to: LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The ROW/ROP functions compute both the wet and dry landing distances for the current conditions. The system then compares these values with the LDA of the landing runway. To detect the landing runway, the ROW/ROP functions use the TAWS runway database and the current aircraft position and track. During final approach:

- The detection starts from 2 000 ft, then
- The ROW function arms at 500 ft.

L2 The landing runway detection is continuously updated several times per second, including below 500 ft when the ROW function is armed.

L1 The computation occurs in real time, the ROW and ROP functions consider:
- All landing weight and CG ranges (this includes overweight landing)
- Both landing configurations (CONF 3 and CONF FULL)
- LDA
- All wind conditions
- Dry and wet runway conditions
- No failure that affects landing performance
- 15 % safety margin.

If a risk of overrun is detected (computed landing distances are more than the LDA) the ROW/ROP triggers:
- Visual alert messages displayed on the PFDs
- Aural alert messages provided through loudspeakers.

ROW FUNCTION

The ROW function provides enhanced flight crew awareness about the approach stabilization and the capability to land on available landing distance.

ROW ARMING

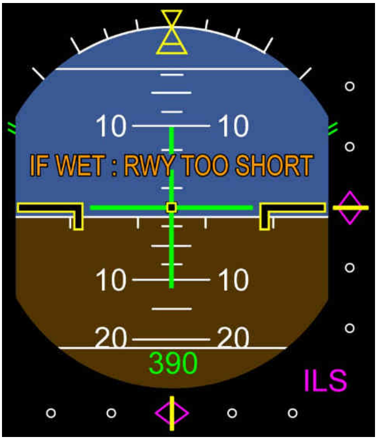
During the approach, the ROW function detects the landing runway according to the aircraft position, and the TAWS runway database.
At 500 ft AGL, the ROW function automatically arms, and starts to compute both the wet and dry landing distances for current aircraft and environmental conditions.

The ROW function computes the landing distance with the following assumptions:
- Maximum manual brake pressure
- Idle reverser thrust for the computation for dry runway
- Maximum reverser thrust for the computation for wet runway.

ROW ACTIVATION

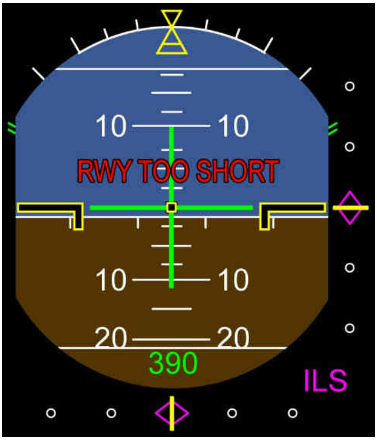
Below 400 ft, if the computation for wet landing distance is more than the LDA:

- The IF WET: RWY TOO SHORT message is displayed on both PFDs. This message flashes for 9 s and then remains steady. This message is not associated with an aural alert.



Below 400 ft, if the computation for dry landing distance is more than the LDA:

- The RWY TOO SHORT message is displayed on both PFDs. This message flashes for 9 s and then remains steady. In addition, when reaching 200 ft , a repetitive aural alert “RUNWAY TOO SHORT" triggers.



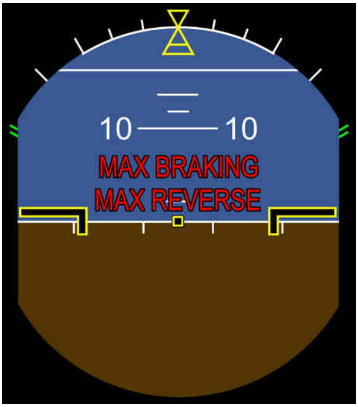
When the landing distance computation is less than the LDA, the alerts stop.

ROP FUNCTION

The ROP function provides enhanced flight crew awareness about the deceleration and capability to stop before the end of the runway.

ROP ACTIVATION

On ground, the ROP function computes the braking distance for the current aircraft and runway conditions. If current braking performance is not sufficient to stop on LDA, it triggers visual and aural alerts.
As soon as an overrun situation is detected MAX BRAKING and MAX REVERSE messages are displayed on both PFDs. They flash for 9 s and then remain steady.



At the same time, the aural alert “BRAKE, MAX BRAKING, MAX BRAKING” is triggered and continues until the system detects maximum manual brake pressure.
When the flight crew applies maximum manual brake pressure, the aural alert “SET MAX REVERSE” is triggered and continues until the system detects maximum reverse thrust.

Note: *The aural alert “BRAKE, MAX BRAKING, MAX BRAKING" has priority over “SET MAX REVERSE".*

Below 80 kt, the aural alert “KEEP MAX REVERSE” is triggered, if the system still detects overrun situation with maximum manual brake pressure and maximum reverse thrust.
If the overrun situation is no longer detected, alerts are no longer triggered.

ROP INHIBITION

The ROP function is inhibited when the ground speed decreases below 30 kt.

OPERATING PROCEDURES

For operating procedure related to ROW/ROP (*Refer to FCTM/AS-ROWROP General*).

OVERVIEW

Ident.: DSC-34-20-60-10-00020237.0001001 / 17 MAR 17
Applicable to: ALL

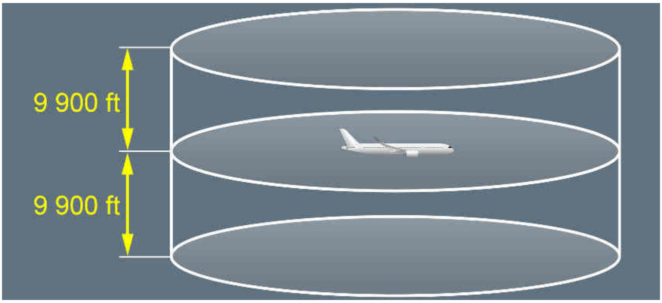
The Traffic Collision Avoidance System (TCAS):
- Detects and displays surrounding aircraft that have a transponder
- Calculates and display possible collision threats
- Triggers vertical speed orders, in order to avoid collisions.

PRINCIPLE

Ident.: DSC-34-20-60-10-00020239.0001001 / 05 JUN 18
Applicable to: ALL

The TCAS detection capability is limited to intruders flying within a maximum range of 30 NM on either sides and approximately 30 NM to 100 NM longitudinally (depending on aircraft configuration and external conditions), and within a maximum altitude range of 9 900 ft above and below the aircraft.

TCAS Range

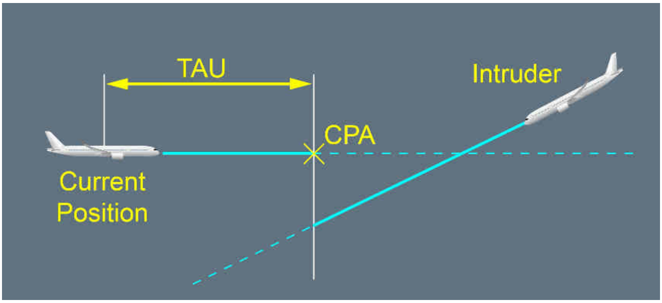


The TCAS obtains data transmitted by the transponders of nearby aircraft, and uses this data to evaluate possible collision threats.

The TCAS determines:
- The bearing of intruders, in relation to the bearing of the aircraft
- The distance between the aircraft and intruders, and the rate of separation or closure
- The relative altitude of intruders, if intruders report their altitude via a Mode-C or Mode-S transponder.

The TCAS then calculates the intruder trajectory, the Closest Point of Approach (CPA), and the estimated time (TAU) before reaching the CPA.
The TAU is the ratio between the distance that separates both aircraft, and the sum of their speed.

TAU Definition



If the TCAS detects that the trajectory of an intruder may be a collision threat, it triggers:

- Audio and visual indicators
- Vertical speed orders, to ensure a sufficient trajectory separation and a minimal vertical speed variation considering all intruders.

MAIN COMPONENTS

Ident.: DSC-34-20-60-10-00020240.0001001 / 17 MAR 17
Applicable to: ALL

The system includes:

- A single channel TCAS computer
- Two TCAS antennas
- Two mode S ATC transponders, one active the other in standby.

  These transponders allow:
  - Interface between the ATC/TCAS control panel and the TCAS computer
  - Communication between the aircraft and intruders equipped with a TCAS system.
- An ATC/TCAS control panel.

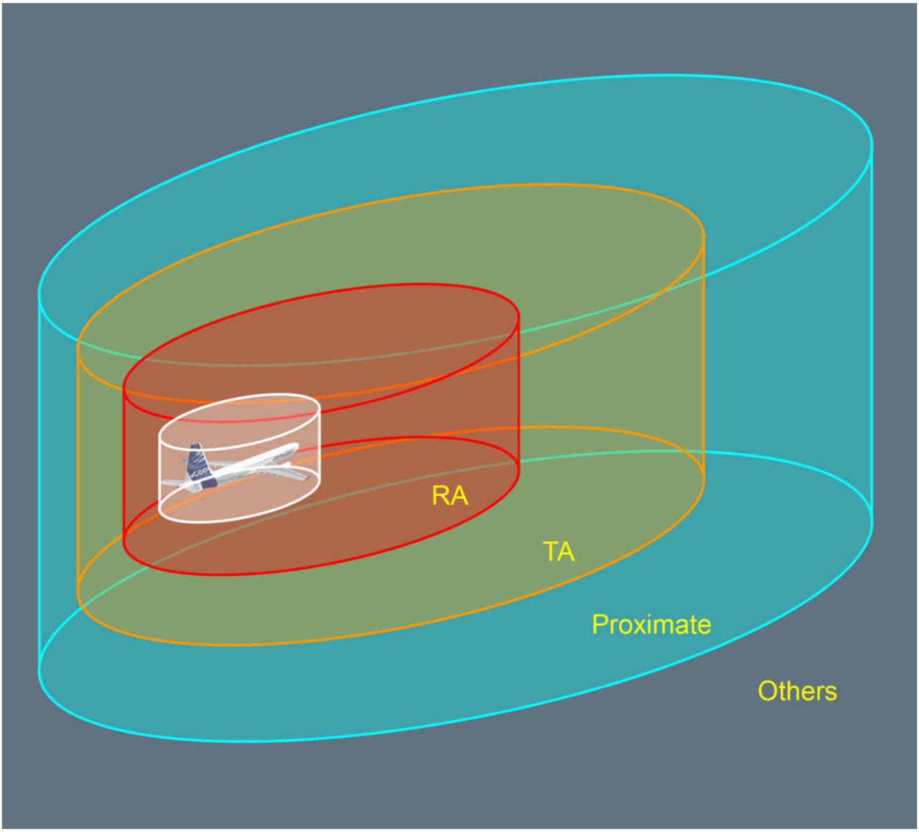
INTRUDER DETECTION CATEGORIES

Ident.: DSC-34-20-60-10-00020247.0001001 / 26 NOV 19
Applicable to: ALL

The TCAS divides the space surrounding the aircraft into the following four zones, in order to evaluate and categorize possible collision threats:
- Resolution Advisory (RA)
- Traffic Advisory (TA)
- Proximate intruders
- Other intruders.

TCAS Envelopes



Depending on the level of the collision threat, the TCAS triggers audio and visual indicators:

LEVEL	INTRUDER POSITION	DISPLAYED INFORMATION AND MESSAGE	
Other intruders	- No collision threat - Any non-proximate, TA, RA within the surveillance envelope (lateral range: Closer than 30 NM)	- ND: Intruder position	Proximate	- No collision threat - Intruder in the vicinity of the A/C (closer than 6 NM laterally and ±1 200 ft vertically)	- ND: Intruder position	Traffic Advisory (TA)	- Potential collision threat - TAU is about 40 s	- ND: Intruder position - Aural messages	Resolution Advisory (RA)	- Real collision threat - TAU is about 25 s	- ND: Intruder position - Aural messages - PFD: Vertical orders • Maintain actual V/S (Preventive Advisory) or • Modify V/S (Corrective Advisory)	
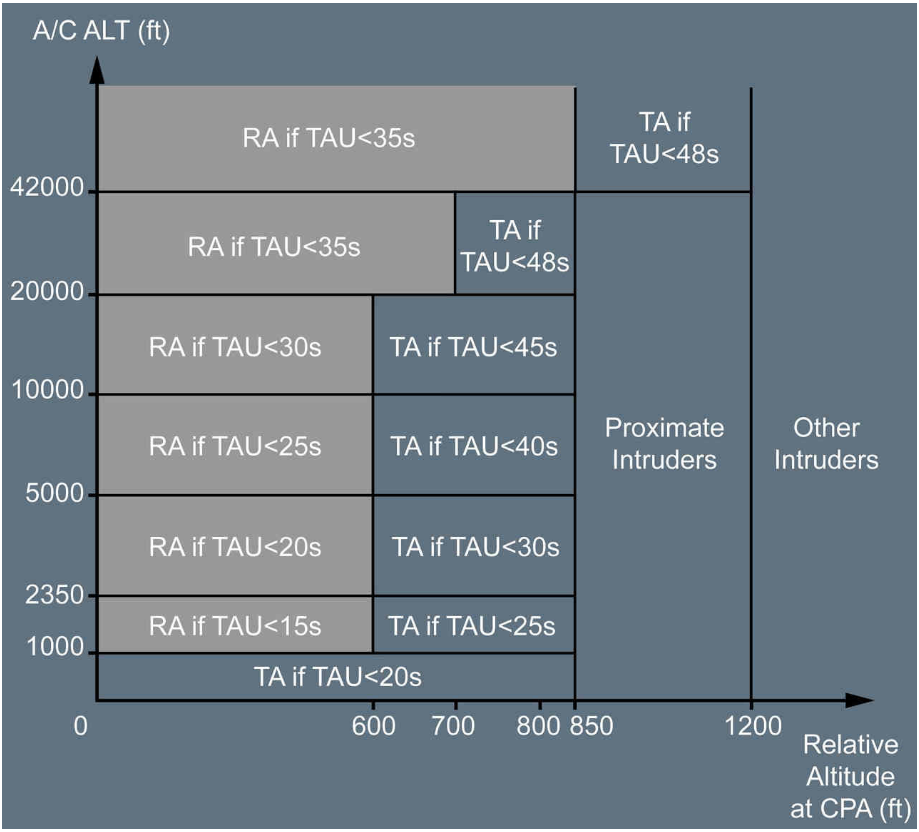
TA/RA thresholds



TCAS MODES

Applicable to: ALL

Ident.: DSC-34-20-60-10-10-00020248.0001001 / 17 MAR 17

TCAS MODES

The TCAS has three different modes of operations that can be selected on the ATC/TCAS control panel:
- The Traffic Advisory/Resolution Advisory (TA/RA) mode
- The Traffic Advisory Only (TA ONLY) mode
- The standby (STBY) mode.

Ident.: DSC-34-20-60-10-10-00020249.0001001 / 17 MAR 17

TRAFFIC ADVISORY/RESOLUTION ADVISORY (TA/RA) MODE

The TA/RA mode is the normal TCAS operating mode that enables:
- The ND to display all intruders
- The PFD to display the vertical speed orders that indicate the vertical direction that the aircraft should take, in order to avoid a collision.

Ident.: DSC-34-20-60-10-10-00020250.0001001 / 17 MAR 17

TRAFFIC ADVISORY ONLY (TA ONLY) MODE

The TA ONLY mode can be selected:
- Manually in case of aircraft degraded performance (engine failure, landing gear extended), or in specific airports, and for specific procedures (identified by operators) that may provide RA that are neither wanted nor appropriate (e.g. closely-spaced parallel or converging runways).
- Automatically, if TA/RA mode is previously selected and:
  - The windshear alert is triggered
  - The stall warning is triggered
  - GPWS alerts are triggered
  - Aircraft is below 1 000 ft AGL.

When the TCAS is operating in TA ONLY mode:
- All RAs are inhibited and converted into TAs (TCAS flight guidance mode is inhibited)
- TA threshold is set to TAU ≤20 s, irrespective of the aircraft’s altitude
- No vertical speed advisories are indicated on the PFDs
- “TA ONLY” is displayed on the NDs.

Ident.: DSC-34-20-60-10-10-00020251.0001001 / 17 MAR 17

STANDBY MODE

In the standby mode, the advisory generation and surveillance functions are not active. The TCAS does not trigger any alert. No TCAS information can be displayed on the PFDs and NDs.

AP/FD TCAS

Ident.: DSC-34-20-60-10-00020252.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

MODE

The AP/FD TCAS mode is a vertical guidance mode of the AP/FD.

In the case the TCAS generates a Resolution Advisory (RA) alert, this mode automatically engages to assist the flight crew to follow the RA orders, and to revert toward initial trajectory:
- Automatically if the AP is engaged, or
- Manually with the guidance of the Flight Director (FD), if the AP is not engaged.

The AP/FD TCAS mode optimizes the vertical speed for a rapid and appropriate response to an RA, and minimizes the deviations from the latest ATC clearance.
When the TCAS is operating in TA only mode, the AP/FD TCAS mode is inhibited.

INTRUDER DETECTION

Based on the received information from the intruders, the TCAS may generate the following sequence of alerts:

- **If the TCAS considers the intruder to be a possible collision threat:**
  - It generates a visual and aural Traffic Advisory (TA).
  - In that case, the AP/FD TCAS mode automatically arms: TCAS appears on the FMA to inform the flight crew that the AP/FD TCAS mode will be available in the case a Resolution Advisory (RA) is subsequently triggered.
- **If the TCAS considers the intruder to be a real collision threat:**
  - It generates a visual and aural Resolution Advisory (RA).
  - The AP/FD TCAS mode automatically engages: TCAS appears on the FMA. The flight crew has vertical guidance to fly the RA orders, automatically with the AP/FD, or manually with the FDs only (if AP was not engaged).

- If the A/THR is disconnected, it automatically becomes armed or active, depending on the thrust lever position. When active, the speed/Mach mode engages, and the speed/Mach control becomes selected. For more information, *Refer to DSC-22_30-40-100 Normal Operations - When a RA is triggered*.
- The vertical speed scale on the PFD indicates the vertical speed range within which the aircraft should fly.

● **When the TCAS considers that there is no more collision threat:**

- It triggers the "CLEAR OF CONFLICT" aural alert.
- In most of the cases, the AP/FD TCAS mode automatically reverts to V/S mode. The vertical speed target leads the aircraft toward the FCU selected altitude. If the altitude capture conditions are met at the clear of conflict, the AP/FD TCAS mode can revert to an altitude acquire, or an altitude hold mode. *Refer to DSC-22_30-40-100 Normal Operations - When Clear of Conflict*.

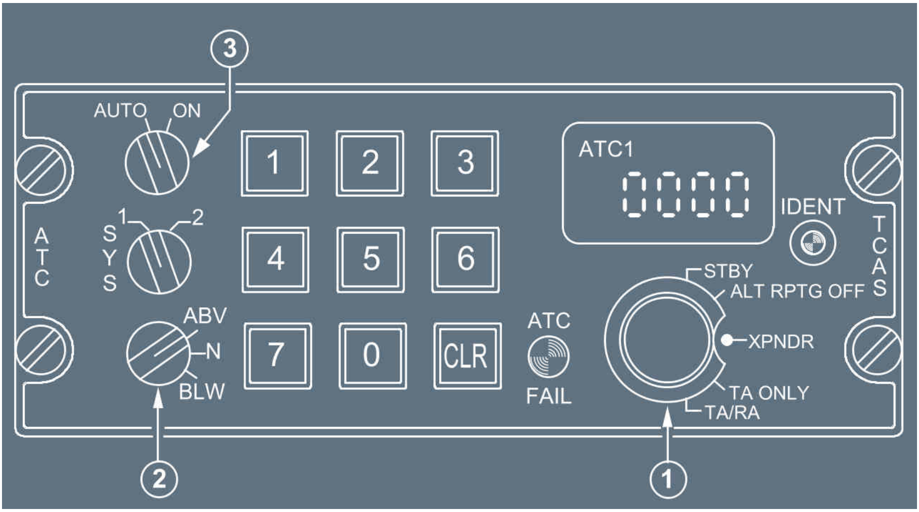
ATC/TCAS PANEL

Ident.: DSC-34-20-60-20-00020255.0015001 / 17 MAR 17
Applicable to: LV-KAN, LV-KAO



(1) Mode selector

TA/RA: Normal position. TAs, RAs, proximate and other intruders are displayed.

TA : This mode should be used in case of aircraft degraded performance (engine failure, landing gear extended, or approach on parallel runways).
All RAs are converted into TAs. TAs, proximate and other intruders are displayed.

STBY : TCAS and ATC are on standby.

XPNDR : - The TCAS is on standby.
- On ground : The selected ATC Transponder only operates in the selective aircraft interrogation mode of Mode S.
- In flight : The selected ATC Transponder operates.

(2) Altitude range switch

Sets the altitude range, within which other intruders will be displayed on the NDs.

ABV : The altitude range is set to +9 900 ft above the aircraft, and -2 700 ft below the aircraft.

N : The altitude range is set to -2 700 ft below the aircraft, and +2 700 ft above the aircraft.

BLW : The altitude range is set to -9 900 ft below the aircraft, and +2 700 ft above the aircraft.

(3) AUTO/ON selector or THRT/ALL selector

ON (or ALL) : All intruders are displayed.

AUTO (or THRT) : Proximate and other intruders are only displayed, if a TA or RA is already presented.

Note: *Some TCAS control panels are equipped with a THRT/ALL selector, instead of the AUTO/ON selector. The associated functions remain unchanged.*

(2) Proximate intruder
Indicated by a white filled diamond.

(3) TA intruder
Indicated by an amber circle.
Associated with the "TRAFFIC-TRAFFIC" aural message.

(4) RA intruder
Indicated by a red square.
Associated with vertical orders displayed on the PFD and aural messages.

Note: *If the range of an intruder is not available, the intruder is not displayed.*
An intruder may be partially displayed when its range is out of scale.

(5) Relative altitude/Vertical Speed arrow

Relative altitude : indicated in hundred of feet above or below the symbol depending on the intruder position.

Vertical speed arrow : displayed only if the intruder vertical speed is greater than ± 500 ft/min

The relative altitude and vertical speed arrow are displayed in the same color as the associated intruder symbol.
When an intruder does not report its altitude, the relative altitude and the vertical movement are not displayed.

(6) No Bearing Intruder

If the bearing of TA or RA intruder is not available the following data is presented in digital form at the bottom of the ND :
- range
- relative altitude and vertical speed arrow if available.

Displayed amber or red according to threat level.

(7) Range Ring
A 2.5 NM white range ring is displayed when a 10 or 20 NM range is selected.

MODE AND RANGE MESSAGES

Following messages can be displayed to draw pilot’s attention:

TCAS : REDUCE RANGE	Displayed when a TA is detected and ND range above 40 NM.
TCAS : REDUCE RANGE	Displayed when a RA is detected and ND range above 40 NM.
TCAS : CHANGE MODE	Displayed when a TA is detected and ND mode is PLAN.
TCAS : CHANGE MODE	Displayed when a RA is detected and ND mode is PLAN.

OPERATION MESSAGES

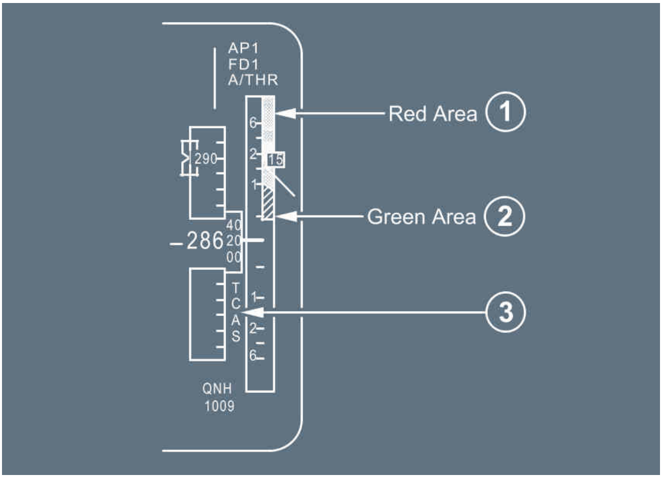
TA ONLY	Displayed when the TA mode is selected automatically, or manually by the flight crew.
TCAS ADS-B (ATSAW)	Displayed in the case of an internal TCAS failure affecting also the ATSAW function.
TCAS ADS-B ONLY (ATSAW)	Displayed in the case of an internal TCAS failure not affecting the ATSAW function. *Note:* *TCAS symbols are removed from ND. ATSAW traffic is displayed with "ADS-B Only" symbols.*
ADS-B (ATSAW)	Displayed in the case of ATSAW failure without TCAS failure. *Note:* *ATSAW traffic symbols are removed from ND. TCAS symbols remain available.*

PFD INDICATIONS

Ident.: DSC-34-20-60-20-00020258.0002001 / 17 MAR 17
Applicable to: ALL

In case of RA detection, the vertical speed scale becomes rectangular and the PFD presents vertical orders on the vertical speed scale. The vertical speed scale background is normally grey, but may be partially replaced by green and/or red areas.

Note: *When TCAS information has to be displayed on the vertical speed scale, the grey background of the air speed and heading scales are removed.*



(1) Red area
Indicates the vertical speed where the risk of conflict is high.

(2) Green area
Indicates the recommended vertical speed range. ("FLY TO" sector).

Note: *The aircraft can also fly in the grey vertical speed range without the risk of conflict (preventive RA).*

(3) TCAS message
It is displayed when the TCAS cannot deliver RA data, or in case of a TCAS internal failure, provided that the TCAS is not in standby.

Note: *When within the red area, the vertical speed needle and digits change to red, but in a different pattern, so that it is possible to clearly distinguish them from the background.*

AURAL MESSAGES

Ident.: DSC-34-20-60-20-00020267.0012001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

TA/RA detection is associated with the following messages:

“TRAFFIC TRAFFIC”	:	Only in case of TA detection.
"CLIMB CLIMB"	:	Climb at the vertical speed indicated by the green area on the PFD.
“CLIMB, CROSSING CLIMB” (twice)	:	Same as above. Indicates that you will cross through the intruder altitude.

“INCREASE CLIMB” (twice) : Triggered after the CLIMB message, if the vertical speed is insufficient to achieve safe vertical separation.
“DESCEND, DESCEND" : Descend at the vertical speed indicated by the green area on the PFD.
“DESCEND, CROSSING DESCEND” (twice) : Same as above. Indicates that you will cross through the intruder altitude.
“INCREASE DESCEND” (twice) : Triggered after the DESCEND message, if the vertical speed is insufficient to achieve safe vertical separation.
"LEVEL OFF, LEVEL OFF" : Set the Vertical Speed to 0.
“CLIMB, CLIMB NOW” (twice) : Triggered after the DESCEND message, if the intruder trajectory has changed.
“DESCEND, DESCEND NOW” (twice) : Triggered after the CLIMB message, if the intruder trajectory has changed.
“MONITOR VERTICAL SPEED” : Ensure that the vertical speed remains outside the red area. Triggered only once, in case of preventive RA.
"MAINTAIN VERTICAL SPEED, MAINTAIN" : Maintain the vertical speed within the green area and/or out of the red area of the vertical speed scale.
"MAINTAIN VERTICAL SPEED ... CROSSING MAINTAIN" : Maintain the vertical speed indicated on the green area of the PFD. Indicates that you will cross through the intruder altitude.
“CLEAR OF CONFLICT” : The range increases, and separation is adequate. Return to assigned clearance.

AURAL MESSAGES

Ident.: DSC-34-20-60-20-00020267.0004001 / 17 MAR 17
Applicable to: LV-GKO, LV-GKP

TA/RA detection is associated with the following messages:
“TRAFFIC TRAFFIC” : Only in case of TA detection.
"CLIMB CLIMB" : Climb at the vertical speed indicated by the green area on the PFD.
“CLIMB, CROSSING CLIMB” (twice) : Same as above. Indicates that you will cross through the intruder altitude.
“INCREASE CLIMB” (twice) : Triggered after the CLIMB message, if the vertical speed is insufficient to achieve safe vertical separation.

"DESCEND, DESCEND"	Descend at the vertical speed indicated by the green area on the PFD.
"DESCEND, CROSSING DESCEND" (twice)	Same as above. Indicates that you will cross through the intruder altitude.
"INCREASE DESCEND" (twice)	Triggered after the DESCEND message, if the vertical speed is insufficient to achieve safe vertical separation.
"ADJUST VERTICAL SPEED, ADJUST"	Adjust the vertical speed to that indicated by the green area of the PFD, reducing climb vertical speed or descent vertical speed, as appropriate.
"CLIMB, CLIMB NOW" (twice)	Triggered after the DESCEND message, if the intruder trajectory has changed.
"DESCEND, DESCEND NOW" (twice)	Triggered after the CLIMB message, if the intruder trajectory has changed.
"MONITOR VERTICAL SPEED"	Ensure that the vertical speed remains outside the red area. Triggered only once, in case of preventive RA.
"MAINTAIN VERTICAL SPEED, MAINTAIN"	Maintain the vertical speed within the green area and/or out of the red area of the vertical speed scale.
"MAINTAIN VERTICAL SPEED ... CROSSING MAINTAIN"	Maintain the vertical speed indicated on the green area of the PFD. Indicates that you will cross through the intruder altitude.
"CLEAR OF CONFLICT"	The range increases, and separation is adequate. Return to assigned clearance.

MEMO DISPLAY

Ident.: DSC-34-20-60-20-00020268.0018001 / 17 MAR 17
Applicable to: ALL

TCAS STBY : This memo appears in amber in flight phase 6 when:

- The flight crew selects TCAS STBY or ATC STBY on the ATC/TCAS panel, or
- Both ATCs or both RAs fail, or
- The flight crew turns OFF the ALT RPTG sw, or
- In the case of a triple ADR failure.

TCAS STBY : This memo appears in green in flight phases 2 and 7 when:

- The flight crew selects TCAS STBY or ATC STBY on the ATC/TCAS panel, or
- Both ATCs or both RAs fail, or
- The flight crew turns OFF the ALT RPTG sw, or
- In the case of a triple ADR failure.

DESCRIPTION

Ident.: DSC-35-10-00000932.0001001 / 10 JAN 11
Applicable to: ALL

The oxygen system consists of:
- A cockpit-fixed oxygen system, which supplies adequate breathing oxygen to the cockpit occupants in case of depressurization, or emission of smoke and noxious gases.
- A cabin-fixed oxygen system, which supplies oxygen for cabin occupants (passengers and cabin crew) in case of depressurization.
- A portable oxygen system, which is provided in both the cockpit and cabin and is to be used:
  - As PROTECTION for the crew during on board emergencies.
  - For FIRST AID purposes.

Intentionally left blank

GENERAL

Ident.: DSC-35-20-10-00017595.0001001 / 21 MAR 16
Applicable to: ALL

The cockpit's fixed oxygen system consists of:

- One (or two ◁) high-pressure cylinder located in the left-hand lower fuselage
- One (or two ◁) pressure regulator, connected directly to the cylinder that delivers oxygen, at a pressure suitable for user
- Two overpressure safety systems to vent oxygen overboard, through a safety port, if the pressure becomes too high
- A supply solenoid valve that allows the crew to shut off the distribution system
- Four full-face quick-donning masks, stowed in readily-accessible boxes adjacent to the crewmembers seats (one at each seat)
- One or two filling port for external oxygen replenishment ◁ .

OPERATION

Ident.: DSC-35-20-10-00017203.0001001 / 31 MAR 17
Applicable to: ALL

The crewmember squeezes the red grips to pull the mask out of its box, and this action causes the mask harness to inflate.
A mask-mounted regulator supplies a mixture of air and oxygen or pure oxygen, or performs emergency pressure control. With the regulator set to NORMAL, the user breathes a mixture of cabin air and oxygen up to the cabin altitude at which the regulator supplies 100 % oxygen. The user can select 100 %, in which case the regulator supplies pure oxygen at all cabin altitudes.
If the situation calls for it, the user can use the emergency overpressure rotating knob and receive pure oxygen at positive pressure.
The storage box contains a microphone lead, with a quick-disconnect, for connection to the appropriate mask microphone cable.

Applicable to: ALL

Step 1
Step 2
Step 3
Step 4
Step 5
OXYGEN MASK
PRESS TO TEST AND RESET

STEP 1

Coil the supply hose that is connected to the crew oxygen mask in an "eight (8)" symbol and place it in the bottom of the stowage box.

STEP 2

Position the remaining hose in the middle of the mask.
Fold the two harness portions together.

STEP 3

Put the mask in the stowage box.
Make sure that the mask touches the bottom of the stowage box.

STEP 4

Close the doors of the mask stowage box.
Firmly press the PRESS TO TEST AND RESET pb.
When released, check that the OXY ON flag disappears.

STEP 5

Press the EMERGENCY selector, and check that the blinker remains black.
Return the N/100% selector to the 100% position.

CAUTION	Maintaining the EMERGENCY selector in the EMERGENCY position can deplete the crew oxygen cylinder.

MASK MAN ON
R
AUTO
PASSENGER
SYS ON
CREW SUPPLY
OFF
1

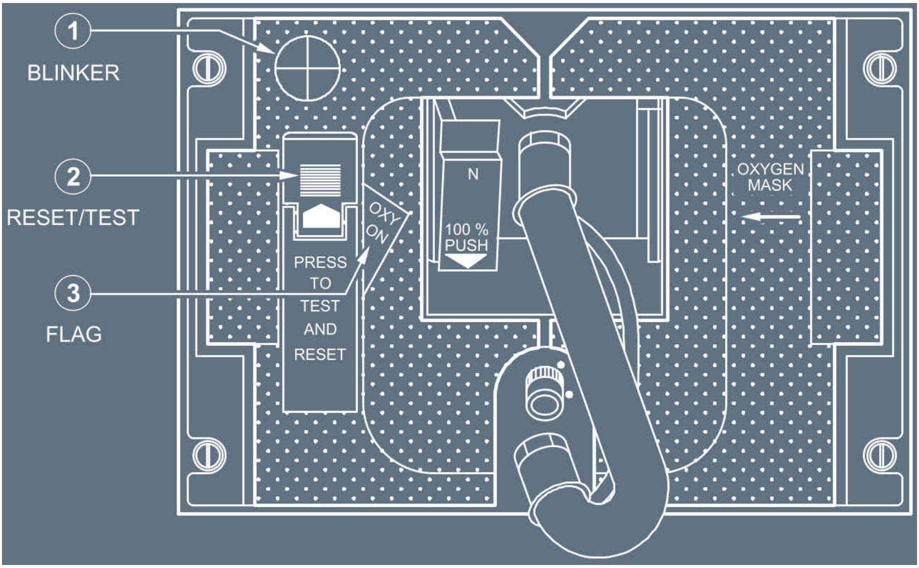
(1) CREW SUPPLY pushbutton
This pushbutton controls the solenoid valve.

On : The valve is open, and supplies low pressure oxygen to the masks (normal position in flight).

OFF: The valve is closed, and the white light comes on.

LATERAL CONSOLES

Ident.: DSC-35-20-20-00000977.0001001 / 09 OCT 12
Applicable to: ALL



(1) Blinker flowmeter (yellow)
This indicator flashes when oxygen is flowing.

(2) RESET / TEST control slide
The crewmember presses the slide, and pushes it in the direction of the arrow to test: The operation of the blinker, the regulator supply, the system sealing downstream of the valve, and the regulator sealing and system operation. Pressing the RESET control slide, after the oxygen mask has been used, cuts off the oxygen and the mask microphone.

(3) OXY ON flag
As soon as the left flap door opens, the mask is supplied with oxygen and, once it closes (mask still supplied with oxygen), the “OXY ON“ flag appears.

CREW OXYGEN MASK

Applicable to: ALL

(1) Red grips
Squeezing the righthand side grip unlocks the two-flap door and permits the harness to inflate.

(2) EMERGENCY pressure selector

Use of this selector creates an overpressure, which eliminates condensation or fogging of the mask, and prevents smoke, smell or ashes from entering the mask.
- Pressing this knob generates an overpressure for a few seconds.
- Turning the knob, in the direction of the arrow, generates a permanent overpressure.

Note: *1. Overpressure supply is automatically started, when cabin altitude exceeds 30 000 ft .*

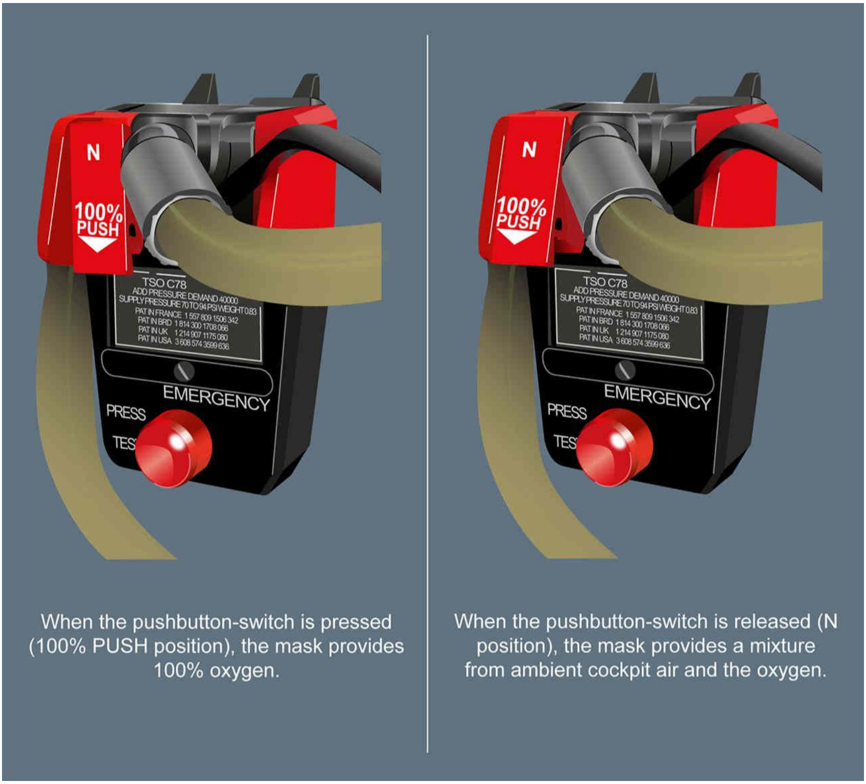
2. Overpressure supply is available, only when the N/ 100 % selector is set on the 100 % position.

(3) N/100 % sel

This two-position button is locked down (100 % position) when the crewmember pulls the mask out of the stowage. Pushing up the button from underneath releases it, and it pops up to the N (normal) position. Pressing it again returns it to 100 %.

100 % : The mask delivers 100 % oxygen.

N : The mask provides the flight crew with a mixture of air and oxygen. This mixture changes with cabin altitude. The higher the cabin altitude, the more oxygen the mask provides, until the mask supplies 100 % oxygen.



N
100% PUSH

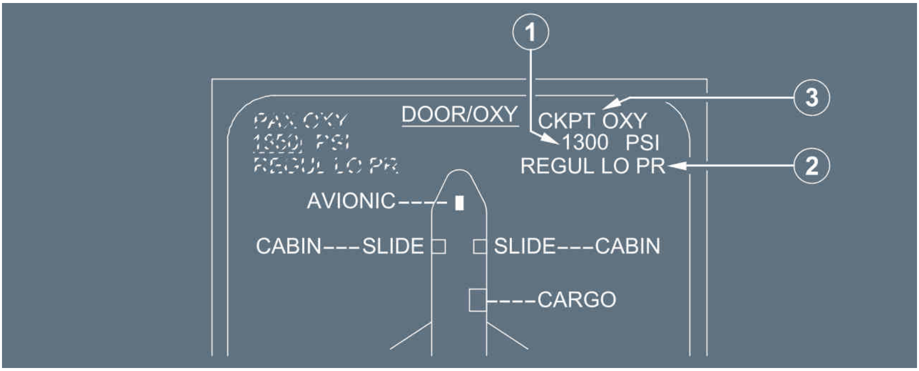
PRESS
TES

When the pushbutton-switch is pressed (100% PUSH position), the mask provides 100% oxygen.

When the pushbutton-switch is released (N position), the mask provides a mixture from ambient cockpit air and the oxygen.

ECAM DOOR/OXY PAGE

Ident.: DSC-35-20-20-00000987.0005001 / 21 MAR 17
Applicable to: ALL



(1) OXY pressure indication
It is in green, when the pressure is greater than, or equal to 600 PSI.
It pulses in green, when the pressure is less than 600 PSI (the DOOR/OXY page is automatically displayed).
It is in amber, when the pressure is less than 300 PSI.
On ground, an amber half frame appears when oxygen pressure is less than 1 000 PSI.
In this case, the flight crew must check that the remaining quantity is not below the minimum (*Refer to LIM-OXY Minimum Flight Crew Oxygen Pressure*).

(2) REGUL LO PR indication
It is in amber, if oxygen pressure on the low-pressure circuit is low (50 PSI).

(3) CKPT OXY indication
It is normally in white.

It becomes amber, when:
- The pressure goes below 300 PSI.
- Low oxygen pressure is detected.
- The overhead panel's OXYGEN CREW SUPPLY pushbutton is OFF.

Intentionally left blank

HOW TO TEST THE MASK

Ident.: DSC-35-20-30-00024454.0001001 / 04 NOV 20
Applicable to: ALL

WARNING	To prevent hearing damage to ground crew connected to the intercom system, inform them that a loud noise may be heard in the headset when performing the oxygen mask test.

OXYGEN MASK

- **On the OXYGEN panel:**
  CREW SUPPLY pb....................CHECK ON
- **On the glareshield:**
  LOUDSPEAKERS....................ON
- **On the ACP:**
  INT reception knob....................PRESS OUT - ADJUST
  INT/RAD sw....................INT

- **On the mask stowage box:**
  - Press and hold the RESET/TEST button in the direction of the arrow.
    - Check that the blinker turns yellow for a short time, and then goes black.
  - Hold the RESET/TEST button down, and press the Emergency Pressure selector.
    - Check that the blinker turns yellow and remains yellow, as long as the Emergency Pressure selector is pressed.
    - Listen for oxygen flow through the loudspeakers.
  - Check that the RESET/TEST button returns to the up position and the N/100% selector is in the 100 % position.
  - Press the Emergency Pressure selector again, and check that the blinker does not turn yellow. This ensures that the mask is not supplied.
  - Check that the Emergency Pressure selector is NOT turned right in the direction of the arrow (permanent overpressure). This ensures that the oxygen permanent overpressure is not supplied.

GENERAL

Ident.: DSC-35-30-10-00017210.0001001 / 05 MAR 19
Applicable to: ALL

In the case of depressurization, the fixed oxygen system in the cabin supplies oxygen to the cabin occupants.
Chemical generators ◁ produce the oxygen. Each generator supplies a group of 2, 3, 4, 5 or 6 masks. Oxygen masks are located in containers above the passenger seats, in the lavatories, in each galley, and at each cabin crew station.

Note: *Gazeous generators (if installed) replace chemical generators in the lavatories.*

OPERATION

Ident.: DSC-35-30-10-00017596.0001001 / 21 MAR 16
Applicable to: ALL

Each container has an electrical latching mechanism that automatically opens to allow the masks to drop, if the cabin pressure altitude exceeds 14 000 ft (+250, -750 ft).
Flight crewmembers can override the automatic control.
When the masks are released, the passenger address system automatically broadcasts prerecorded instructions ◁ .
Oxygen supply begins, when the passenger pulls the mask towards the passenger seat. The chemical reaction used for oxygen generation creates heat. Therefore, a smell of burning, smoke, and an increase in cabin temperature may be associated with the normal operation of the oxygen generators. The mask receives pure oxygen under positive pressure for about 15 min ◁ , 22 min ◁ or up to 36 min ◁ , until the generator is exhausted.
A reset is available for the rearming of the system after the masks are restowed.
A manual release tool allows the crew to open the doors manually, in case of electrical failure. It is stored at the cabin attendants' station.

As soon as cabin oxygen masks fall down in the cabin, either automatically, or manually.

OXY PAX ON : This memo appears in green, when:

- Both CPCs detect excessive cabin altitude, or
- One CPC detects excessive cabin altitude and the other CPC is failed.

OXY PAX ON : This memo appears in amber, when:

- Both CPCs are inoperative, or do not detect excessive cabin altitude, or
- Both CPCs are operative, and only one CPC detects excessive cabin altitude.

FLIGHT CREWS PORTABLE OXYGEN SYSTEM

Ident.: DSC-35-40-10-00000994.0001001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

The smoke hood on the left back side of the cockpit protects the eyes and respiratory system of one member of the flight crew while the flight crew is fighting a fire, or if smoke and/or noxious gases enter the cabin, or if the cabin loses pressure.
The smoke hood is equipped with one oxygen cylinder and one CO2 absorption system which furnish an effective time of use of 15 min.
A « ready for use » status of the hood is ensured by checking that the indicator mounted on the hood container is not red.

There is one Protective Breathing Equipment (PBE) in the cockpit. The PBE is a hood, located in a container. The PBE is stored on the left aft side of the cockpit. It ensures the eyes and respiratory system protection of one flight crew member when fighting a fire and in case of smoke or noxious gas emissions or cabin depressurization.
The PBE uses a chemical air regeneration system, which is in the breathing bag. An oronasal mask allows the user to inhale regenerated air, and it returns the exhaled breath to the regeneration system.

If the container is equipped with a yellow serviceability indicator:

- When the indicator is cracked, the breathing protection can be insufficient and therefore the PBE cannot be used.

If the container is equipped with a red/green serviceability indicator:

- When the indicator is green, the PBE can be used.
- When the indicator is red, the breathing protection can be insufficient and therefore the PBE cannot be used.

The hood operates for at least 15 min.

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The pneumatic system supplies high pressure air for :
- Air conditioning
- Engine starting
- Thrust reversers
- Wing anti-icing
- Water pressurization
- Hydraulic reservoir pressurization.
- Pack bay ventilation turbofan actuation
- Cargo heating ◁
- Fuel Tank Inerting System (FTIS) ◁ .

High pressure air is supplied from three sources :
- Engine bleed systems
- APU load compressor
- Two HP ground connections.

Note: *An external HP source may be used for air conditioning.*

Engine bleed systems are interconnected by a crossbleed duct, to which the APU and ground sources are connected.
A valve, mounted on the crossbleed duct, allows the left side (ENG 1) and the right side (ENG 2) to be interconnected.
Pneumatic system operation is controlled and monitored by two Bleed Monitoring Computers (BMC 1 and 2), the overhead control panel and the ECAM. The APU bleed supply is controlled by the APU Electronic Control Box (ECB).
A leak detection system is provided to detect any overheat in the vicinity of the hot air ducts.

Engine bleed systems are interconnected by a crossbleed duct, to which the APU and ground sources are connected.
A valve, mounted on the crossbleed duct, allows the left side (ENG 1) and the right side (ENG 2) to be interconnected.
Pneumatic system operation is controlled and monitored by two Bleed Monitoring Computers (BMC 1 and 2), the overhead control panel and the ECAM. The APU bleed supply is controlled by the APU Electronic Control Box (ECB).
A leak detection system is provided to detect any overheat in the vicinity of the hot air ducts.

GENERAL

Ident.: DSC-36-10-20-00000840.0007001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Engine bleed systems are similar

Each system is designed to:
- select the air source compressor stage
- regulate bleed air pressure
- regulate bleed air temperature

Each system is controlled and monitored by one Bleed Monitoring Computer.

Each BMC is provided with bleed pressure, temperature and valve position information, and is interconnected to:
- other systems involved with the bleed system
- the other BMC,

and provides indications and warnings to the ECAM and CMC.
In case of failure of one BMC, the other one takes over most of the monitoring functions.
The LH and RH bleed valves are electrically-controlled by BMC1 and BMC2 respectively, and are pneumatically -operated.

ENGINE AIR SUPPLY

Ident.: DSC-36-10-20-00000845.0003001 / 09 OCT 12

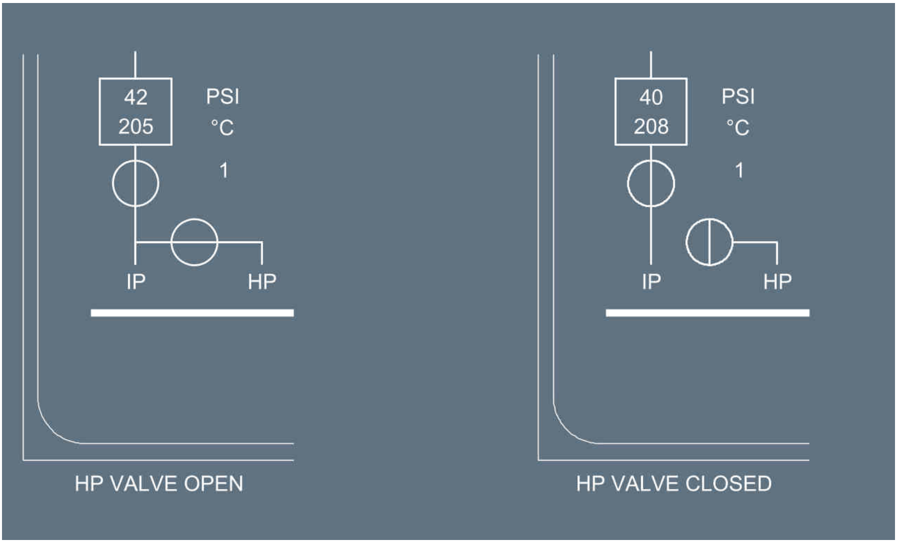
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Air is normally bled from the intermediate pressure stage (IP) of engine HP compressor, to minimize fuel penalty.

When pressure from the IP is not sufficient (low engine speed), air is bled from the high pressure (HP) stage thru the HP valve which limits downstream pressure to 36 ± 4 PSI.
An intermediate pressure check valve, mounted downstream of the IP port , closes to prevent air from HP stage being circulated to the IP stage.

L3 The HP valve is automatically closed
- pneumatically :
  - in case of low upstream pressure
  - in case of excessive upstream pressure
- electrically when :
  - the BLEED valve is electrically controlled closed or,
  - wing anti-ice is OFF and upstream HP valve pressure is > 73 PSI

L1 ECAM INDICATION



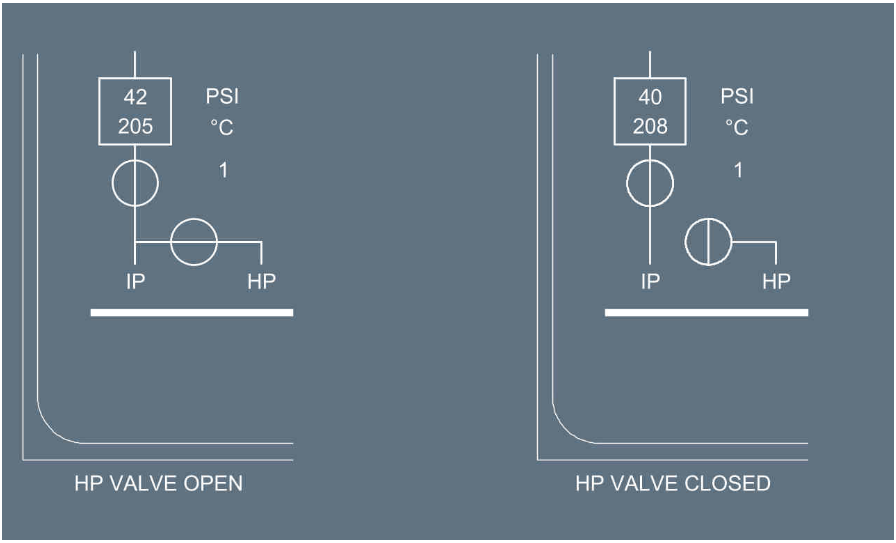
ENGINE AIR SUPPLY

Ident.: DSC-36-10-20-00000845.0004001 / 09 OCT 12
Applicable to: LV-KHT, LV-KHU

Air is normally bled from the intermediate pressure stage (IP) of engine HP compressor, to minimize fuel penalty.
When pressure from IP is not sufficient (low engine speed), air is bled from the high pressure (HP) stage thru the HP valve which limits downstream pressure to 40 ± 4 PSI .

Two intermediate pressure check valves, mounted downstream of each IP port, close to prevent air from HP stage being circulated to the IP stage.

ECAM INDICATION



PRESSURE REGULATION AND LIMITATION

Ident.: DSC-36-10-20-00000858.0003001 / 20 MAR 17
Applicable to: ALL

Downstream of the junction of HP and IP ducting, air is admitted into the bleed valve. This bleed valve acts as a shut-off, and as a Pressure Regulating Valve (PRV).
Delivery pressure is regulated between 44 and 52 PSI , depending on the flow.
The pressure can be reduced, in case of over temperature at the precooler inlet.
In case of a pressure regulation failure, the overpressure valve (OPV) closes, when the pressure is greater than 85 PSI.

The bleed valve is fully closed :
- Pneumatically in case of :
  - Upstream pressure less than 8 PSI, or
  - Engine fire
- Electrically through the:
  - BLEED pushbutton, when switched OFF
  - ENG FIRE pushbutton when pushed
  - BMC, in the following cases :
    - Overtemperature
    - Overpressure
    - Leak detection
    - APU bleed ON (for Engine 2, provided crossbleed valve is not closed).
    - Starting sequence
    - Engine shutdown

TEMPERATURE REGULATION AND LIMITATION

Ident.: DSC-36-10-20-00000861.0001001 / 21 MAR 16
Applicable to: ALL

The temperature regulation of bleed air is achieved by a precooler, that is mounted downstream of the bleed valve.
The precooler is an air-to-air heat exchanger, which uses cooling air that is bled from the engine fan, to regulate the temperature to 200 °C.
Fan airflow is controlled by the fan Air Valve.
When wing anti-ice is selected off, the temperature may be regulated to 150 °C, upon zone controller demand.
The fan air valve is spring-loaded closed, in the absence of pressure.

Intentionally left blank

GENERAL

Ident.: DSC-36-10-30-00000881.0001001 / 09 NOV 17
Applicable to: ALL

Air supplied by the APU load compressor is both available on ground and in flight.
APU bleed air is controlled by the APU bleed valve, which operates as shutoff valve. It is electrically-controlled and pneumatically-operated.
The APU bleed valve is controlled by the APU BLEED pushbutton, located on the AIR panel.
When, the pushbutton is set to ON, APU bleed air supplies the pneumatic system, provided APU N is greater than 95 %. This causes the crossbleed valve to open and the engine bleed valves to close.
If the APU bleed valve is opened, it automatically closes in the case of APU leak, left wing leak, or pylon 1 leak (except during engine start). *Refer to DSC-36-10-60 Leak Detection*.
A non-return valve, located near the crossbleed duct, protects the APU when air is bled from another supply source.

Intentionally left blank

HP GROUND AIR SUPPLY

Ident.: DSC-36-10-40-00000899.0001001 / 06 JUN 16
Applicable to: ALL

Air is supplied to the aircraft's pneumatic system via two HP ground connectors. The crossbleed valve has to be opened manually to provide air for both sides.

Intentionally left blank

GENERAL

Ident.: DSC-36-10-50-00000908.0004001 / 20 MAR 17
Applicable to: ALL

There is a crossbleed valve on the crossbleed duct. This valve enables the isolation or interconnection of LH (ENG1) and RH (ENG2) air supply system.

The crossbleed valve is electrically controlled from a rotary selector that is located on the overhead AIR panel.

Two electric motors control the crossbleed valve : One is for automatic mode, the other is for manual mode.

In automatic mode, the crossbleed valve is normally closed. It opens when APU bleed air is used. It closes, if the system detects an air leak (except during engine start). *Refer to DSC-36-10-60 Leak Detection*.

ECAM INDICATION

Intentionally left blank

LEAK DETECTION

Ident.: DSC-36-10-60-00000912.0006001 / 20 MAR 17
Applicable to: LV-GKO, LV-GKP

The air leakage detection loops detect any ambient overheat in the vicinity of the hot air ducts in the fuselage, pylons and wings.
The sensing elements are tied to form a single loop, for pylon and APU, or, a double loop for the wing.
A wing leak signal is activated when the two loops detect a leak, or when one loop detects the leak and the other is inoperative.
The system has identical control logic included in each BMC.

- In case of wing leak signal
  - The engine bleed valve and HP valve on the affected wing are automatically closed.
  - The associated ENGINE BLEED FAULT light on the AIR panel are illuminated
  - The X-bleed valve automatically closes (except when manually selected open).
  - If the APU bleed valve is opened, and if the leak affects the left wing, the APU bleed valve automatically closes.
- In case of pylon leak signal
  - The bleed valves and the HP valves on the affected side are automatically closed
  - The FAULT light associated with the related engine is illuminated on the AIR panel
  - The X-bleed valve automatically closes (except during an engine start or manually selected open).
  - If the APU bleed valve is opened, and if the leak affects pylon 1, the APU bleed valve automatically closes (except during engine start).
- In case of APU leak signal
  - The APU bleed valve automatically closes
  - The FAULT light illuminates on the APU BLEED pushbutton on the AIR panel.
  - The X-bleed valve automatically closes (except when manually selected open).
  - If the APU bleed valve is closed, the engine 1 bleed valve and engine 1 HP valve automatically close.

APU bleed leak detection is performed only by BMC 1.

LEAK DETECTION

Ident.: DSC-36-10-60-00000912.0007001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The air leakage detection loops detect any ambient overheat in the vicinity of the hot air ducts in the fuselage, pylons and wings.
The sensing elements are tied to form a single loop, for pylon or, a double loop for the wing and APU.

A wing or APU leak signal is activated when the two loops detect a leak, or when one loop detects the leak and the other is inoperative.
The system has identical control logic included in each BMC.

- In case of wing leak signal
  - The engine bleed valve and HP valve on the affected wing are automatically closed.
  - The associated ENGINE BLEED FAULT light on the AIR panel are illuminated
  - The X-bleed valve automatically closes (except when manually selected open).
  - If the APU bleed valve is opened, and if the leak affects the left wing, the APU bleed valve automatically closes.
- In case of pylon leak signal
  - The bleed valves and the HP valves on the affected side are automatically closed
  - The FAULT light associated with the related engine is illuminated on the AIR panel
  - The X-bleed valve automatically closes (except during an engine start or manually selected open).
  - If the APU bleed valve is opened, and if the leak affects pylon 1, the APU bleed valve automatically closes (except during engine start).
- In case of APU leak signal
  - The APU bleed valve automatically closes
  - The FAULT light illuminates on the APU BLEED pushbutton on the AIR panel.
  - The X-bleed valve automatically closes (except when manually selected open).
  - If the APU bleed valve is closed, the engine 1 bleed valve and engine 1 HP valve automatically close.

BMC FAILURE

Ident.: DSC-36-10-70-00000924.0004001 / 19 JAN 11
Applicable to: LV-GKO, LV-GKP

If one BMC is failed the other BMC takes over monitoring of the bleed system and ensures the following ECAM warnings:
- ENG BLEED FAULT (overpressure and overtemperature only)
- WING LEAK
- BLEED LO TEMP (if wing anti ice is on)

Nevertheless the associated FAULT light on the AIR panel is lost, and the bleed valve does not close automatically.
ENG BLEED LEAK warning is lost for the associated engine as well as APU BLEED LEAK warning if BMC1 is concerned.

BMC FAILURE

Ident.: DSC-36-10-70-00000924.0005001 / 19 JAN 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

If one BMC is failed the other BMC takes over monitoring of the bleed system and ensures the following ECAM warnings:
- ENG BLEED FAULT (overpressure and overtemperature only)
- WING LEAK
- APU BLEED LEAK
- BLEED LO TEMP (if wing anti ice is on)

Nevertheless the associated FAULT light on the AIR panel is lost, and the bleed valve does not close automatically.
ENG BLEED LEAK warning is lost for the associated engine.

On : The bleed valve opens, provided:
- Upstream pressure is above 8 PSI.
- The APU BLEED pb-sw is OFF, or the APU bleed valve is closed.
- There is no onside wing or pylon leak, overpressure, or overtemperature detected.
- The ENG FIRE pushbutton is not released out
- The ENG start valve is closed.

FAULT lt : illuminates amber, associated with ECAM caution, in case of:
- Bleed valve is not closed during engine start
- Bleed valve is not closed with APU bleed ON (and for RH engine X-bleed open).

and additionally associated with autoclosure of the bleed and HP valves:
- Overpressure downstream of the bleed valve.
- Bleed overheat
- Wing or pylon leak on the related side.

It goes off, when the ENG BLEED pushbutton is OFF, provided the failure has disappeared.

OFF : The Bleed valve and HP valve close. OFF light comes on white. The FAULT light and the autoclosure signal are reset.

(2) APU BLEED pb sw

ON	:	APU valve opens provided: - N > 95 % - Altitude < 25 000 ft climbing or < 23 000 ft descending - No leak detected on APU or LH bleed (Should a leak occur on the RH side, the X-bleed would close). ON light illuminates blue.
Off	:	APU valves closes.
FAULT lt	:	illuminates amber, associated with ECAM caution, when APU leak is detected.

(3) X-BLEED sel

AUTO	:	X-bleed valve is open if APU bleed valve is open X-bleed valve is closed if APU bleed valve is closed.
OPEN	:	X-bleed valve is open.
CLOSE	:	X-bleed valve is closed.

HP VALVES

Crossline - Green : The HP valve is fully closed.

In line - Green : The HP valve is not fully closed.

Crossline - Amber : The HP valve disagrees in the fully closed position, or
The HP valve is fully closed and the associated engine is not running, or
The HP valve is fully closed and the associated ENG BLEED pb-sw is OFF.

In line - Amber : The HP valve is not fully closed and the associated engine is not running, or
The HP valve is not fully closed and the associated ENG BLEED pb-sw is OFF.

ENGINE BLEED VALVES

In line - Green : The bleed valve is normally open.

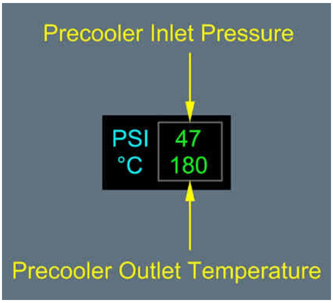
Crossline - Green : The bleed valve is fully closed (by manual or automatic control).

In line - Amber : The bleed valve disagrees in the open position.

Crossline - Amber : The bleed valve disagrees in the closed position, or
The bleed valve is fully closed and the associated engine is not running.

Note: *In certain circumstances (such as different engine setting, or one minor bleed valve regulation drift), it is possible that one bleed valve on one side closes and will be indicated closed and green on the BLEED SD page. There is no operational impact on the bleed system, provided there is no associated "AIR ENG X BLEED FAULT" ECAM alert.*

ENGINE BLEED INDICATIONS



Precooler inlet pressure

It is normally in green.
It becomes amber, if lower than 4 PSI, or in case the BMC detects an overpressure (above 60 PSI).

Precooler outlet temperature

It is normally in green.
It becomes amber, if the BMC detects an overheat or low temperature.

Overheat: Temperature exceeds:
- 290 °C for more than 5 s, or
- 270 °C for more than 15 s, or
- 257 °C for more than 55 s.

Low temperature is detected (only in-flight), if the bleed temperature drops below 150 °C, the wing anti-ice is on, and the pressure regulating valve is in the open position. Low temperature may, however, only be due to low outside air temperature.

Note: *When the engines are at idle, and depending on the ambient temperature, the precooler outlet temperature may be below 150 °C (displayed in amber).*

APU BLEED VALVE

Displayed only if the APU MASTER SW is ON.

Crossline - Green : APU valve not fully open and APU BLEED pushbutton is OFF

Crossline - Amber : APU bleed valve is not fully open and APU BLEED pushbutton is ON.

In line - Green : APU valve fully open

CROSSBLEED VALVE

Crossline - Green : crossbleed valve is normally closed.

In line - Green : crossbleed valve is normally open.

Crossline - Amber : crossbleed valve disagrees in closed position.

In line - Amber : crossbleed valve disagrees in open position.

In transit - Amber : crossbleed valve in transit

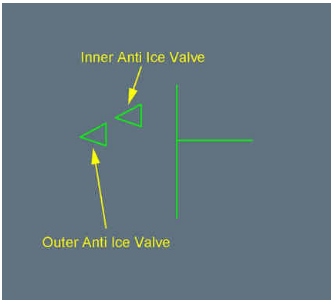
GND HP GROUND CONNECTION INDICATION

△ GND : displayed in white on the ground

ANTI ICE INDICATION

Displayed in white, if the WING pushbutton on the ANTI ICE panel is ON and both valves on the related side are open. The associated anti ice indication becomes amber if:
- the position of at least one valve of the related side disagrees with the anti ice selection
- at least one arrow symbol is amber on the related side.

ARROWS



ARROW DISPLAY	
Not displayed	Valve is closed.
Green	Valve is normally open.
Amber	Valve is open, and at least one of the following conditions is met: - Bleed air pressure high, or low - Wing anti-ice pushbutton is at OFF position - Open for more than 35 s, while the aircraft is on ground.

MEMO DISPLAY

Ident.: DSC-36-20-00017082.0001001 / 21 MAR 16
Applicable to: ALL

APU BLEED : This memo appears in green, if the APU is available and the APU BLEED pb-sw is ON.

Potable Water....B
Wastewater System....C
Toilet System....D
Architecture....E

Intentionally left blank

GENERAL

Ident.: DSC-38-10-00017388.0001001 / 21 MAR 16
Applicable to: ALL

The water and waste systems:
- Distribute potable water to the toilets and the galleys
- Dispose waste water
- Store toilet wastes.

The system is insulated to prevent water leaks and ice build up.
The water and waste control panel is located on the Forward Attendant Panel (FAP).

POTABLE WATER

Ident.: DSC-38-10-00017389.0001001 / 21 MAR 16
Applicable to: ALL

Potable water is stored in two 350 l water tanks (or three 350 l water tanks ◁✻) located in the aft cargo compartment, in sidewalls.
On ground, the water system is pressurized by the air from the service panel pressure port. In flight, the water system is pressurized by bleed air.
If bleed air is not available and the air pressure is not sufficient for the normal operation of the potable water system, an electrical compressor ◁✻ starts automatically.
Potable water is piped to the galleys and lavatories. Manual shutoff valves isolate the washbasins and toilets from the water system. The manual shutoff valves are located behind an access door, under the toilet bowl. The position of each valve is indicated by OPEN and SHUT legend. A placard inside the access door gives instructions on the operation of the manual shutoff valve.
The system can be filled or drained from the service panel at the bottom of the fuselage. For tank filling, the quantity of the potable water is preselected on the FAP.
The indication of the water quantity in the tanks is displayed on the FAP.

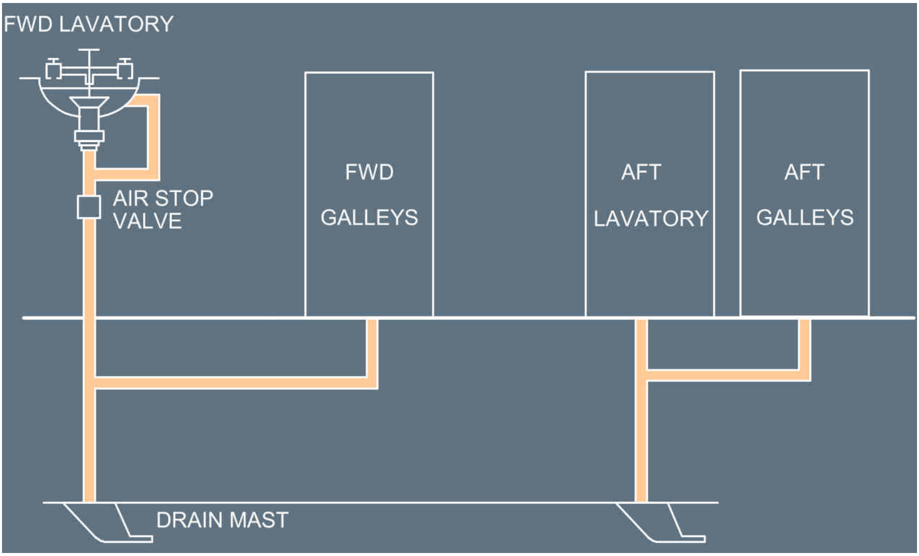
WASTEWATER SYSTEM

Ident.: DSC-38-10-00017390.0001001 / 21 MAR 16
Applicable to: ALL

The waste/water (from galleys and lavatories) drains overboard through two heated drain masts.

The forward mast drains the waste/water from the forward cabin. The aft mast drains the waste/water from the aft cabin.

The waste and water are discharged by:
- Gravity, on ground
- Differential pressure, in flight.



TOILET SYSTEM

Ident.: DSC-38-10-00017391.0001001 / 03 NOV 22
Applicable to: ALL

The aircraft has a vacuum toilet system for the toilets and the 2 waste storage tanks (or 1 waste storage tank ◁ , or 3 waste storage tanks ◁).
The total capacity for the 2 waste storage tanks is 676 l (or 750 l for 1 waste storage tank ◁ , or 1 014 l for 3 waste storage tanks ◁).
In flight, differential pressure forces waste from the toilet into the waste storage tanks.
On ground and at low flight altitude (below 16 000 ft), each waste storage tank has a vacuum generator that provides the necessary differential pressure.
Clean water from the potable water system flushes the toilets.
A flush control unit controls the flush sequence in each toilet.
The vacuum system controller (VSC) ensures the system control, monitoring and fault reporting.

The VSC transmits information to:
- The FAP to indicate the waste tank levels and report system defects
- The centralized fault display system to indicate the system defects to the maintenance.

Ground personnel services the waste tanks via a service panel, located under the fuselage.
A manual shutoff valve isolates an inoperative toilet. The manual shutoff valve is located on the right side of each toilet bowl.

GENERAL

Ident.: DSC-45-10-00000926.0001001 / 21 MAR 16
Applicable to: ALL

The purpose of the Central Maintenance System (CMS) is to ease the maintenance task by directly indicating, in the cockpit, the fault messages and allowing some specific tests.

Two levels of maintenance are possible :
At the line stop : Equipment removal
At the main base : Troubleshooting

COMPONENTS

Ident.: DSC-45-10-00000928.0002001 / 21 MAR 16
Applicable to: LV-GKO, LV-GKP, LV-KAN, LV-KAO

The CMS includes :
- The Built In Test Equipment (BITE) of all electronic systems
- Two fully redundant Central Maintenance Computers (CMCs)
- Three MCDUs (Multipurpose Control Display Units) used also for FMGS, ACMS (Aircraft Condition Monitoring System) and ATSU (Air Traffic Service Unit), which dialogue with the CMC for display of information or initiation of tests
- One printer (A4 format)

Usually only CMC 1 is used, when CMC 2 is in standby. CMC 2 will automatically take over if CMC 1 fails.
A pushbutton on the overhead panel allows to force the transfer to CMC 2, by setting the CMC 1 to OFF.

COMPONENTS

Ident.: DSC-45-10-00000928.0003001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KHT, LV-KHU

The CMS includes :
- The Built In Test Equipment (BITE) of all electronic systems
- One Central Maintenance Computer (CMC)
- Three MCDUs (Multipurpose Control Display Units) used also for FMGS, ACMS (Aircraft Condition Monitoring System) and ATSU (Air Traffic Service Unit), which dialogue with the CMC for display of information or initiation of tests
- One printer (A4 format)

MODES OF OPERATION

Ident.: DSC-45-10-00000938.0001001 / 21 MAR 16
Applicable to: ALL

The CMS operates in two main modes :
- The NORMAL mode or REPORTING mode in flight
- The INTERACTIVE mode or MENU mode on ground

In NORMAL mode, the CMS records and displays the failure messages permanently transmitted by each system BITE.
In INTERACTIVE mode, the CMS enables the connection of any BITE system with the MCDU, in order to display the maintenance data stored and formated by the system BITE, or to initiate a TEST.

FAILURE CLASSIFICATION

Ident.: DSC-45-10-00000970.0001001 / 16 NOV 11

Applicable to: ALL

There are three classes of failure:

Class 1 :	Failures indicated to the flight crew by means of a flight deck effect (e.g. ECAM or instrument flags).
Class 2 :	Failures which can be left uncorrected until the next scheduled maintenance check (Management of these failures is handled by the Trouble Shooting Manual (TSM) and should be rectified within the timescale defined in the TSM).
Class 3 :	Failures not indicated to the flight crew, with no fixed time quoted for correction.

Failure Classes	Class 1	Class 2	Class 3
Operational consequences	YES	NO	NO
Indication to the flight crew	YES Automatically displayed in real time: - Warning or caution messages on Engine Warning Display - Flags on Primary Flight Display or Navigation Display, or System Display, - Local warning	*Refer to MEL/MI-00-08 ECAM and MAINTENANCE STATUS*	NO
Dispatch consequences	Refer to MEL may be: - ”GO” - ”GO IF” - ”NO GO”	MEL not applicable. “GO” without conditions. These failures should be rectified within the timescale defined in the TSM.	MEL not applicable. No fixed time quoted for corrections. However, correction is recommended to improve dispatch reliability.
Indication to the maintenance team	YES Automatically print out at the end of each flight : Failure messages on the CMC Post Flight Report		YES On request, when needed, Failure messages on CMC Class 3 Report.

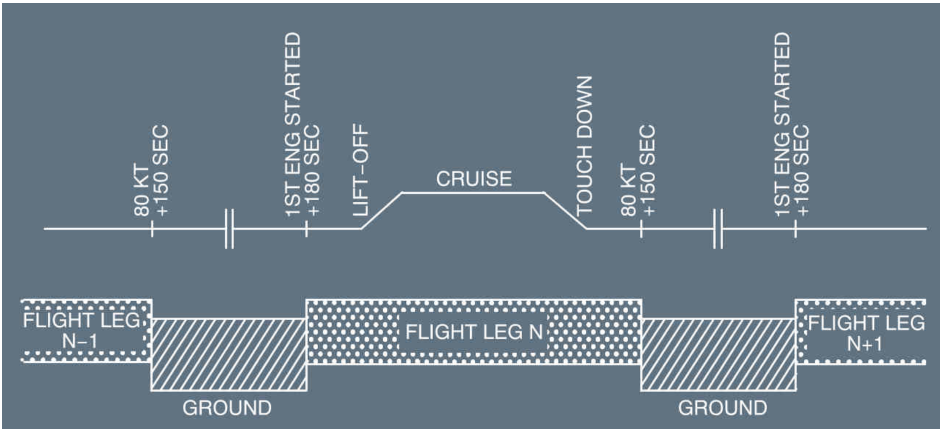
Note: *Most Class 1 failures have an operational consequence on the current flight. Some Class 1 failures, such as MINOR FAULT, have no operational consequence on the current flight, but must be corrected in accordance with the MEL preamble, or the time specified in the associated dispatch condition of the MEL.*

CMS FUNCTIONS

Ident.: DSC-45-10-00000973.0004001 / 22 MAR 16
Applicable to: ALL

The main CMS functions are the :

- Acquisition and storage of messages transmitted by the connected system BITEs, or by the Flight Warning Computer (Warning / Caution titles).
- Elaboration of the maintenance phases.



80 KT +150 SEC
1ST ENG STARTED +180 SEC

GROUND
GROUND

- Elaboration of the maintenance reports :
  - POST OR CURRENT FLIGHT REPORT :
    Presents all ECAM warning/caution and failure messages (Class 1 and 2 failures) recorded during the last or current flight leg.
    Available in flight and on ground.
  - PREVIOUS FLIGHT REPORT :
    Presents all ECAM and failure messages recorded during the 63 previous flight legs (post flight reports).
    Available on ground only.
  - AVIONICS STATUS :
    Presents, in real time, the systems affected by a failure.
    Available in flight and on ground.
  - CLASS 3 REPORT :
    Presents the Class 3 failure messages detected during the last flight leg.
    Available on ground only.
  - SYSTEM REPORT/TEST :
    Allows interactive dialogue between any system and the MCDU.

Available on ground only..

- "X" indicates that the warning message has been presented to the crew in real time (flight phase inhibition).
- "06" indicates the flight phase.

The POST or CURRENT FLIGHT REPORT is automatically printed after engine shutdown, or manually by selecting the PRINT key.
It is also automatically downlinked to the airline ground computer after engine shutdown, or manually by selecting SEND.

In this example, the operator has accessed to the menu of the selected systems :
- LAST or PREVIOUS LEG REPORT : presents the list of LRU affected by a failure.
- LRU IDENT : contains the P/N of all LRUs of the system.
- GND SCANNING : runs the flight monitoring on ground and presents the faulty LRU.
- TROUBLE SHOOT DATA : provides system internal data concerning each failure.
- CLASS 3 FAULT : presents class 3 failures detected by the system during the last flight leg.
- TEST : runs the power up test and system test (if any) and display the result.
- GROUND REPORT : presents the list of LRU affected by a failure with the aircraft on ground.

UTC/DATE INIT

Ident.: DSC-45-20-00001027.0002001 / 21 MAR 16
Applicable to: ALL

The CMC transmits to the aircraft systems, and the lower ECAM displays the GMT coming from the main clock).
In case of cockpit clock failure, the internal clock of the CMC (synchronized on the cockpit clock) takes over. If, in addition, there is a long power interrupt (greater than 5 s), crew action is required to initialize the GMT and DATE via the MCDU.

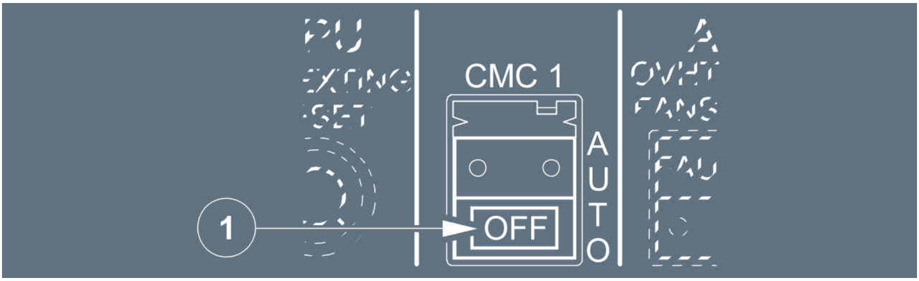
Applicable to: ALL



(1) CMC 1 pb sw

AUTO	:	CMC 1 is active while CMC 2 ⊲ is in stand-by. CMC 2 ⊲ automatically takes over if CMC 1 fails.
OFF	:	CMC 1 selected off. CMC 2 ⊲ is active.

DESCRIPTION

Ident.: DSC-45-30-00001036.0006001 / 22 JUL 14
Applicable to: ALL

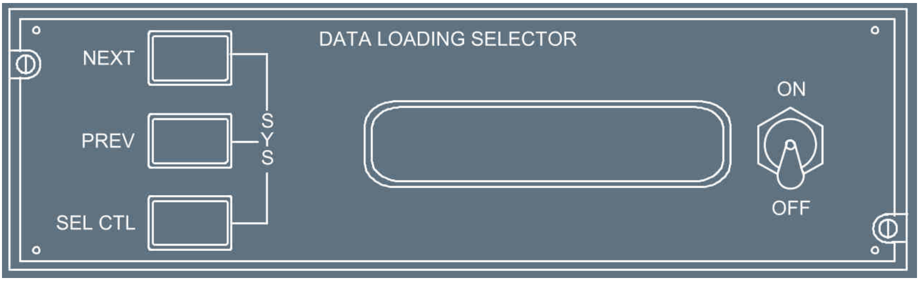
The data loading system is an interface between aircraft systems and ground-based data processing stations.

The data loading system enables:
- To upload database or to modify operational software in aircraft systems, or
- To download system reports from various aircraft systems.

The connection between the data loading system and the ground-based data processing stations is performed:
- Via the Multipurpose Disk Drive Unit (MDDU) ◁ , using 3.5 diskettes, or
- Via the Centralized Data Loading Connector (CDLC) ◁ .

The Data Loading Selector on the overhead panel enables to guide data to and from selected aircraft systems.

The Data Loading Selector enables to select the following aircraft systems:
- FMGEC
- SATCOM ◁
- HFDR ◁
- CBMU
- TCAS
- ELMU
- FDIMU
- DMC
- BMC
- CMC
- ATSU
- EEC

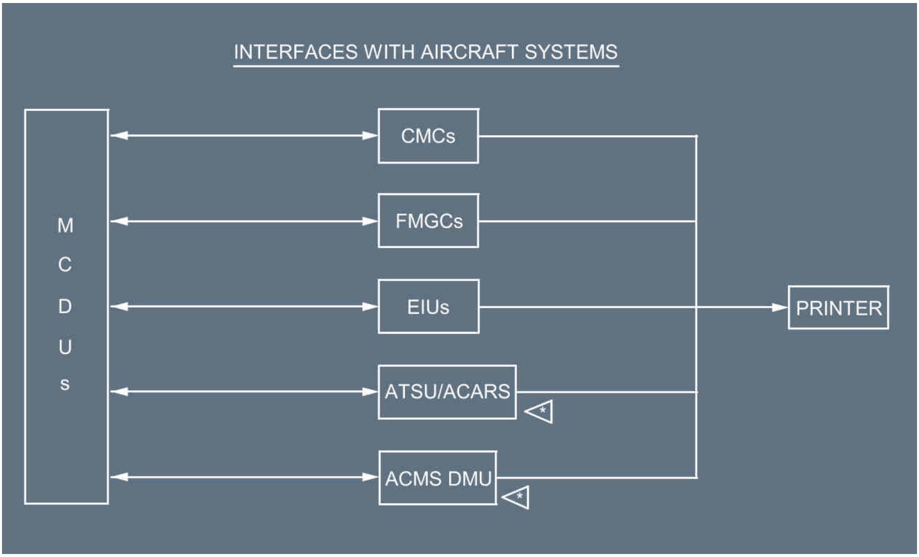


- The screen displays the selected system.
- The ON/OFF sw enables to turn ON or OFF the data loading system,
- The NEXT and PREV enable to scroll the list of applicable aircraft systems which are displayed on the screen,
- The SEL CTL enables to select or deselect the displayed aircraft system.

DESCRIPTION

Ident.: DSC-45-35-00016075.0001001 / 03 FEB 15
Applicable to: ALL

The printer is the output unit for data printing, which can be either generated manually from the MCDUs, or automatically depending on the system.
The data printouts are described in the CMC FUNCTIONS description (*Refer to DSC-45-20 CMC RECONFIGURATION*), or in the related system descriptions.

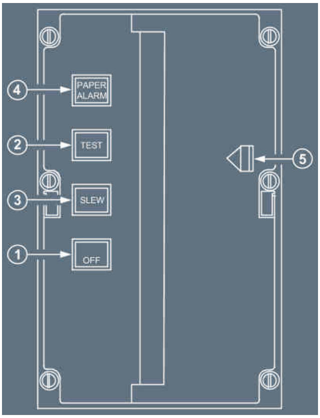


The printer is installed at the rear of the pedestal on the F/O’s side.

CONTROLS AND INDICATORS

Ident.: DSC-45-35-00001043.0001001 / 03 FEB 15
Applicable to: ALL

Depending on the type of printer installed on the aircraft, the flight crew may use one of the following descriptions.



(1) OFF pb-sw

OFF : OFF light comes on steady, printer is off.

On : OFF light extinguishes. Then the printer is normal operation provided that:
- No indication light on the front panel is on
- The access door is closed
- There is paper in front of the print head.

Note: When an internal fault in the printer is detected, the OFF light will come on steady.

(2) TEST pb

TEST : When pressed and released, the printer is performing a self-test provided that the printer is not in communication with a connected system.

(3) SLEW pb-sw

SLEW : When pressed and released, the printer unrolls the paper.

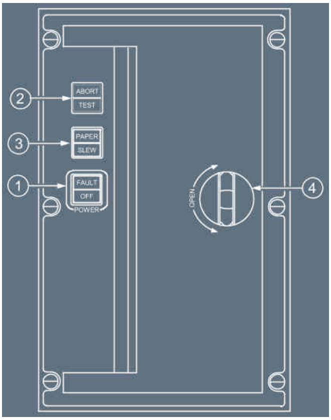
(4) PAPER ALARM pb-sw

PAPER ALARM : This light comes on steady when the paper roll is missing, empty or low.

Note: If SLEW pb-sw and PAPER ALARM pb-sw are pressed and released at the same time:
- *The printer aborts the printing in progress, PAPER ALARM light is on, or*
- *The printer moves the paper backward provided that the access door is open.*

(5) ACCESS DOOR latch

The latch locks the printer access door.
On the inner side of the access door, a label gives paper loading instructions.



(1) OFF/FAULT pb-sw

OFF : OFF light comes on steady, printer is off.

On : OFF light extinguishes. Then the printer is normal operation provided that:
- SLEW light and TEST light are on
- The access door is closed
- There is paper in front of the print head.

FAULT : When an internal fault in the printer is detected, the FAULT light comes on steady.

(2) ABORT/TEST pb-sw

ABORT : When pressed and released, the printer aborts the printing in progress.

TEST : When pressed and released, the printer is performing a self-test provided that the printer is on and no printing is in progress.

(3) PAPER/SLEW pb-sw

PAPER : PAPER light comes on steady when the paper roll is missing, empty or low.

SLEW : When pressed and released, the printer unrolls the paper.

Note: If PAPER/SLEW pb-sw and ABORT/TEST pb-sw are pressed at the same time, the printer moves the paper backward provided that the access door is open.

(4) ACCESS DOOR latch

The latch locks the printer access door.
On the inner side of the access door, a label gives paper loading instructions.

OVERVIEW

Ident.: DSC-46-10-10-00020958.0002001 / 26 NOV 19
Applicable to: LV-GKO, LV-GKP

The datalink has:
- AOC applications ◁

L2 The flight crew uses the AOC applications to communicate with Airline Operational Center (AOC).

L1
- ATC applications ◁

L2 The flight crew uses the ATC applications to communicate with Air Traffic Control (ATC) centers.

L1 The ATC datalink provides communication, navigation, and surveillance for Air Traffic Management (ATM) services.
The ATC datalink applications enable air traffic controllers to follow the aircraft navigation, and enhance the air traffic flow.

The datalink communication (messages exchange) between the aircraft and the ground is achieved:
- Automatically (without a flight crew action)
- Manually (with a flight crew action via the DCDU/MCDU and/or RMP).

The datalink messages are:
- Uplink (from a ground facilities to the flight crew), or
- Downlink (from the flight crew to a ground facilities).

COMMUNICATION AND NAVIGATION FOR AIR TRAFFIC MANAGEMENT

At the beginning of the flight, the flight crew sends a notification message to the ATC center, via the MCDU, notification application ◁ .
Then, an air traffic controller will establish a connection between the aircraft and the ATC center.
As a result, the flight crew can exchange messages with the ATC center, via the DCDU (CPDLC application ◁). The messages that the flight crew sends to the ATC center can be built with present frames and modified via the MCDU.

Depending on the type of datalink exchange, the datalink uses one of the following communication networks:
- ACARS for FANS A ◁ applications
- ACARS Air Traffic Services (ATS 623) for optional applications ◁ .

Note: *FANS A+ ◁ is an evolution of the FANS A ◁ that introduces ATS 623 applications and datalink recording capability.*

ATC DATALINK COMMUNICATION

The ATC datalink provides:
- FANS A applications (FANS 1/A in ICAO designation) using ACARS ground network, for operations in remote areas and in oceanic areas:
  - Notification
  - Controller-Pilot DataLink Communication (CPDLC)
  - Automatic Dependent Surveillance - Contract (ADS-C).

NAVIGATION AND SURVEILLANCE FOR AIR TRAFFIC MANAGEMENT

The Automatic Dependent Surveillance (ADS) system sends aircraft position and aircraft navigation data to ATC centers and other aircraft.

There are two different ADS applications:
- ADS-Contract (ADS-C) ◁
  The ADS-C automatically sends aircraft surveillance data to connected ATC centers via ATC Datalink ◁ in remote or oceanic areas.
- ADS-Broadcast (ADS-B) ◁
  The ADS-B automatically broadcasts the aircraft position and navigation data to other users (ATC centers or other aircraft) equipped with a Mode S transponder. The ATC Datalink ◁ does not host the ADS-B ◁ .

SERVICE PROVIDERS

The role of a communication service provider is to deliver a message from the A/C to a ground end system and vice versa.
A datalink service provider ensures routing of datalink messages between the aircraft and ATC center.

L2 For VHF communication, the two main providers are ARINC and SITA that operate worldwide networks.

L1 REVERSION TO VOICE COMMUNICATION

Voice communication is a primary means of communication on board.

The flight crew must revert from datalink communication to voice communication, if:
- There is an emergency situation (exchange of a critical or urgent message)
- There is a doubt about a datalink message, the voice should be used for clarification
- An operational timer of datalink message exchange times out
- A response to an ATC message was not correctly transmitted via datalink.

CLOCK ACCURACY

The required time precision for ATC datalink communications is +/-1 s UTC. If this constraint is not respected, a rejection of datalink message or acceptance of obsolete datalink message may occur.
Not respecting this constraint may lead to the rejection of messages or to the acceptance of obsolete messages.
For FANS operations, the flight crew should not manually set the clock during cockpit preparation.

OVERVIEW

Ident.: DSC-46-10-10-00020958.0005001 / 26 NOV 19
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The datalink has:
- AOC applications ◁

L2 The flight crew uses the AOC applications to communicate with Airline Operational Center (AOC).

L1
- ATC applications ◁

L2 The flight crew uses the ATC applications to communicate with Air Traffic Control (ATC) centers.

L1 The ATC datalink provides communication, navigation, and surveillance for Air Traffic Management (ATM) services.
The ATC datalink applications enable air traffic controllers to follow the aircraft navigation, and enhance the air traffic flow.

The datalink communication (messages exchange) between the aircraft and the ground is achieved:
- Automatically (without a flight crew action)
- Manually (with a flight crew action via the DCDU/MCDU and/or RMP).

The datalink messages are:
- Uplink (from a ground facilities to the flight crew), or
- Downlink (from the flight crew to a ground facilities).

COMMUNICATION AND NAVIGATION FOR AIR TRAFFIC MANAGEMENT

At the beginning of the flight, the flight crew sends a notification message to the ATC center, via the MCDU, notification application ◁ .
Then, an air traffic controller will establish a connection between the aircraft and the ATC center.
As a result, the flight crew can exchange messages with the ATC center, via the DCDU (CPDLC application ◁). The messages that the flight crew sends to the ATC center can be built with present frames and modified via the MCDU.

Depending on the type of datalink exchange, the datalink uses one of the following communication networks:
- ACARS for FANS A ◁ applications
- ACARS Air Traffic Services (ATS 623) for optional applications ◁ .

Note: *FANS A+ ◁ is an evolution of the FANS A ◁ that introduces ATS 623 applications and datalink recording capability.*

ATC DATALINK COMMUNICATION

The ATC datalink provides:
- FANS A applications (FANS 1/A in ICAO designation) using ACARS ground network, for operations in remote areas and in oceanic areas:
  - Notification
  - Controller-Pilot DataLink Communication (CPDLC)
  - Automatic Dependent Surveillance - Contract (ADS-C).
- ATS 623 applications (ACARS ATS in ICAO designation) using ACARS ground network:
  - Departure Clearance (DCL)
  - Oceanic Clearance (OCL)
  - Digital - Automatic Terminal Information Service (D-ATIS).

For the description of associated Performance-Based Communication and Surveillance (PBCS) concept and requirements, *Refer to PRO-SPO-52-PBCS*.

NAVIGATION AND SURVEILLANCE FOR AIR TRAFFIC MANAGEMENT

The Automatic Dependent Surveillance (ADS) system sends aircraft position and aircraft navigation data to ATC centers and other aircraft.

There are two different ADS applications:
- ADS-Contract (ADS-C) ◁
  The ADS-C automatically sends aircraft surveillance data to connected ATC centers via ATC Datalink ◁ in remote or oceanic areas.
- ADS-Broadcast (ADS-B) ◁
  The ADS-B automatically broadcasts the aircraft position and navigation data to other users (ATC centers or other aircraft) equipped with a Mode S transponder. The ATC Datalink ◁ does not host the ADS-B ◁ .

SERVICE PROVIDERS

The role of a communication service provider is to deliver a message from the A/C to a ground end system and vice versa.

A datalink service provider ensures routing of datalink messages between the aircraft and ATC center.

L2 For VHF communication, the two main providers are ARINC and SITA that operate worldwide networks.

L1 REVERSION TO VOICE COMMUNICATION

Voice communication is a primary means of communication on board.

The flight crew must revert from datalink communication to voice communication, if:
- There is an emergency situation (exchange of a critical or urgent message)
- There is a doubt about a datalink message, the voice should be used for clarification
- An operational timer of datalink message exchange times out
- A response to an ATC message was not correctly transmitted via datalink.

CLOCK ACCURACY

The required time precision for ATC datalink communications is +/-1 s UTC. If this constraint is not respected, a rejection of datalink message or acceptance of obsolete datalink message may occur.
Not respecting this constraint may lead to the rejection of messages or to the acceptance of obsolete messages.
For FANS operations, the flight crew should not manually set the clock during cockpit preparation.

Applicable to: ALL

AIR DATA/INERTIAL REFERENCE SYSTEM (ADIRS)

The ADIRS provide aircraft position data to the FMGEC. The FMGEC consolidates the position value from different sources and transmits it to the ATSU. This is the primary source for the aircraft position.

Ident.: DSC-46-10-10-10-00020954.0001001 / 01 MAR 18
Applicable to: ALL

AIR TRAFFIC SERVICE UNIT (ATSU)

The ATSU controls all datalink communication and automatically selects the best available communication media:
- VHF
- HF
- SATCOM ◁ .

The ATSU hosts:
- AOC applications ◁
- ATC applications ◁
- Router services
  The ATSU router automatically selects VHF frequency, depending on the aircraft position, in accordance with an entered scan mask (airline policy).
  The scan mask means that a list of VHF datalink service providers, selected via the VHF 3 SCAN SELECT page, is scanned, in accordance with their priority level. The VHF scan mask is compulsory for correct router operation. If there is no scan mask, the ECAM displays DATALINK ATSU FAULT – ATSU INIT FAULT.

Ident.: DSC-46-10-10-10-00020950.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

COCKPIT VOICE RECORDER (CVR)

In addition to its voice recording function, the CVR records the data that the flight crew and the air traffic controller exchange.

Ident.: DSC-46-10-10-10-00020955.0001001 / 21 MAR 17
Applicable to: ALL

DATALINK CONTROL AND DISPLAY UNIT (DCDU)

The DCDU enables the flight crew to:

- Read and answer datalink messages, received from the ground
- Display datalink messages, before sending.

Ident.: DSC-46-10-10-10-00021269.0001001 / 21 MAR 17
Applicable to: ALL

FLIGHT MANAGEMENT SYSTEM (FMS)

The ATC datalink interacts with Flight Management Computers (FMC).

The FMS:
- Processes datalink messages
- Prepares/generates an answer to datalink messages
- Monitors clearances
- Reminds the flight crew about a clearance, before reaching a clearance condition.
  When a monitored parameter reaches the assigned value, the FMS generates a reminder message via the DCDU.

Ident.: DSC-46-10-10-10-00020956.0001001 / 21 MAR 17
Applicable to: ALL

FLIGHT WARNING SYSTEM (FWS)

The FWS interacts with the ATSU and:

- Alerts, when a datalink message is received
- Alerts, in the case of detected failures
- Inhibits alerts, depending on the flight phase.

Ident.: DSC-46-10-10-10-00020951.0001001 / 21 MAR 17
Applicable to: ALL

GLOBAL POSITIONING SYSTEM (GPS)

The GPS provides the position information to the FMGEC. The position information is consolidated with the ADIRS data and sent to the ATSU.
The GPS also enables time synchronization to the clock, in order to provide UTC date and time for datalink system. If the GPS fails, the clock continues to calculate the time by incrementing the last received pertinent information as the reference time.

Ident.: DSC-46-10-10-10-00020947.0001001 / 22 MAR 17
Applicable to: ALL

HIGH FREQUENCY (HF)

The HF communication system has:
- Data mode
- Voice mode.

HF communication system can be used in the data mode as an alternative to VHF 3 and SATCOM ◁ . In this case, the communication between the aircraft and HF ground stations is established on a HF frequency. A HF frequency of HF DataLink (HFDL) is tuned automatically.

DATALINK/VOICE SWITCHING

The HF can be used in the voice mode. The flight crew can switch datalink/voice and set a voice frequency via the RMP.

Green HF VOICE memo indicates that HF datalink communication is interrupted, when the HF transceiver operates in the voice mode.

Ident.: DSC-46-10-10-10-00020953.0001001 / 21 MAR 17
Applicable to: ALL

MULTI-PURPOSE CONTROL AND DISPLAY UNIT (MCDU)

The MCDU enables the fight crew to access functions to:

- Manage the ATC datalink connections
- Send notifications
- Edit datalink messages
- Consult reports
- Access Message Record application.

Ident.: DSC-46-10-10-10-00021270.0001001 / 21 MAR 17
Applicable to: ALL

PRINTER

The flight crew can print ATC messages, displayed on the DCDU, or the MCDU.

Note: *Each time the flight crew prints a message, they must check that the printed message is identical to the message on the display unit.*
The reference information is the information, that the display unit displays.

Ident.: DSC-46-10-10-10-00020952.0001001 / 21 MAR 17
Applicable to: ALL

RADIO MANAGEMENT PANEL (RMP)

The flight crew sets a radio frequency into the RMP, when a specific datalink message (e.g.: CONTACT, MONITOR, ...) is received, or when a voice contact is required.

Ident.: DSC-46-10-10-10-00021268.0002001 / 15 MAR 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

Frequencies that some datalink messages contain, can be loaded into RMP via LOAD pb of the RMP.

Ident.: DSC-46-10-10-10-00020945.0001001 / 21 MAR 17
Applicable to: ALL

SATELLITE COMMUNICATIONS (SATCOM) ◁

The SATCOM system ◁ provides voice and data services. The voice/data are transmitted via satellite, from the aircraft to the ground earth stations, and then switched through international telecommunications networks (ARINC, SITA, etc.) to anywhere in the world (airline operational centers, ATC centers, etc).
The ATSU (router) manages switching to/from SATCOM ◁ (ACARS environments only).

Ident.: DSC-46-10-10-10-00020949.0001001 / 21 MAR 17
Applicable to: ALL

SURVEILLANCE SYSTEMS (SURV)

The ATC datalink system interacts with the surveillance system and enables the flight crew to:

- Provide the ATC center with a TCAS status, sent via the ADS application
- Provide the ATC center with the SQUAWK code as a response to CONFIRM SQUAWK uplink message
- Create In-Trail Procedure (ITP) requests for aircraft equipped with ADS-B ◁

L2 The ITP datalink request is an option.

Ident.: DSC-46-10-10-10-00020946.0002001 / 02 JUN 20
Applicable to: ALL

VERY HIGH FREQUENCY (VHF)

The communication between the aircraft and VHF ground stations is established on a VHF frequency. The datalink system primarily uses VHF 3 communication system. The ATSU router automatically selects a VHF frequency, depending on entered configuration, the scan mask for VHF DataLink (VDL), and the aircraft position.
VHF data link service providers are available in each geographical area.

The VHF 3 communication system has:
- Data mode
- Voice mode.

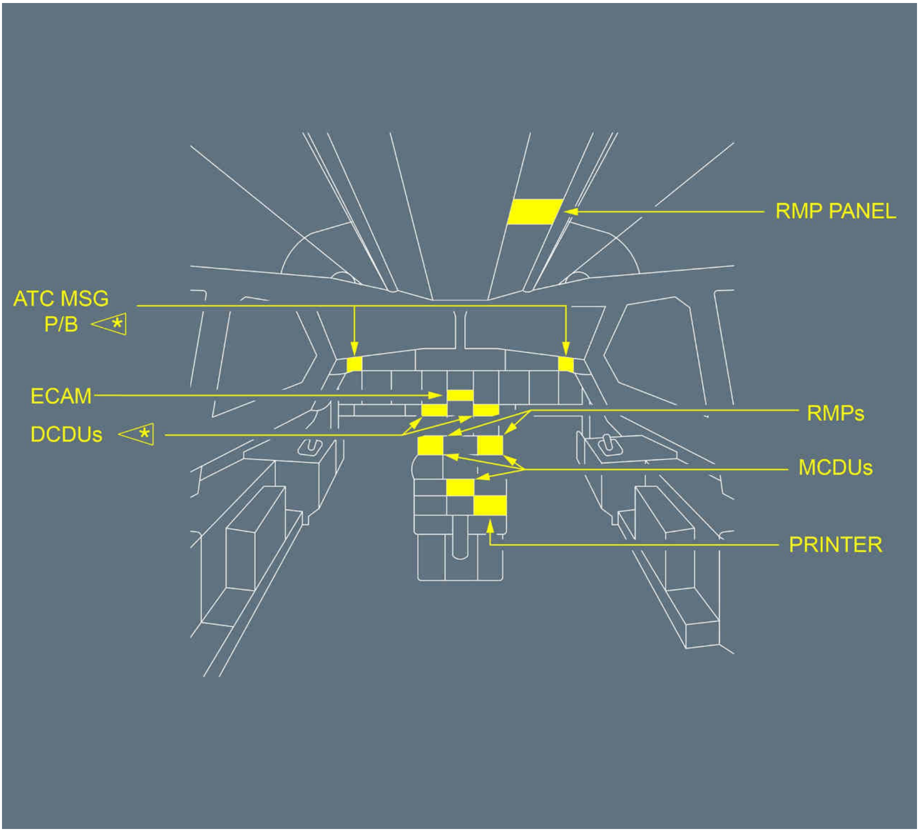
DATALINK/VOICE SWITCHING

The VHF 3 can be used in the voice mode, in case of:
- VHF 1 failure
- VHF 2 failure
- Specific AOC functions (operator's customization)

The flight crew can switch datalink/voice and set a voice frequency via the RMP.

COCKPIT INTERFACE

Ident.: DSC-46-10-10-00020944.0001001 / 21 MAR 17
Applicable to: ALL



The cockpit interface of the datalink system has:

- Datalink Control and Display Unit (DCDU) ◁ on the CAPT and F/O side
  The DCDU displays the uplink and downlink messages and enable the flight crew to control the datalink message exchange.
- ATC MSG pb-sw ◁ on the CAPT and F/O side of the glareshield
  The ATC MSG pb-sw alerts when an uplink message is received and enables the flight crew to cancel the alert.

- Multipurpose Control and Display Unit (MCDU)
  The MCDU enables to manage AOC and ATC functions and data transfer to the DCDU
- Printer
  Datalink messages can be printed, when displayed on the DCDU.
- RMP
  The RMP enables frequency tuning.
- ECAM
  The ECAM informs about the abnormal operation.

DATALINK MESSAGE

Ident.: DSC-46-10-10-30-00020942.0001001 / 21 MAR 17
Applicable to: ALL

UPLINK MESSAGE RECEPTION

When a datalink message is received, the flight crew reads, and manages the messages on the DCDU. The status of received message is OPEN, and changes during processing. Urgent messages or messages with higher priority are automatically displayed to the flight crew.
If a normal message is displayed on the DCDU, when receiving an urgent message, the DCDU will display the urgent message. The normal message stays in the file queue. The flight crew can retrieve the normal message by pressing MSG+/MSG- keys.

Ident.: DSC-46-10-10-30-00020943.0001001 / 21 MAR 17
Applicable to: ALL

UPLINK MESSAGE RECEPTION ALERT

The flight crew is alerted, when a datalink message is received. A dedicated aural alert activates and the ATC MSG pb-sw illuminates on CAPT side and on F/O side.

Note: *The ATC chime is triggered:*
- *Every 15 s, if a normal datalink message is received*
- *Every 5 s, if an urgent datalink message is received*

These cockpit alerts stop, if one of the ATC MSG pb-sw is pushed, or if the flight crew answers the datalink message via the DCDU.

Note: *ATC datalink alerts are inhibited during takeoff and landing phases.*

When a normal datalink message is received, this message will appear on the DCDU screen, if the screen is empty. If the DCDU screen is not empty, this message will not appear on the screen automatically, and the MSG (number) will flash in the information field of the DCDU.
When an urgent datalink message is received, this message will automatically appear on the DCDU screen.

Ident.: DSC-46-10-10-30-00020941.0001001 / 21 MAR 17
Applicable to: ALL

UPLINK MESSAGE RESPONSE

The flight crew can answer to an ATC datalink message:

- Directly
  Several types of datalink messages enable the flight crew to answer directly, via the DCDU. The flight crew can launch preparation of a response message by pressing an appropriate function key (e.g.: WILCO, ROGER, AFFIRM, NEGATIVE, ...), on the DCDU. Consequently, the FMGS will generate a response message on the DCDU. The flight crew can send prepared response message to the ATC by pressing SEND function key of the DCDU.
- Indirectly
  Datalink messages that cannot be answered directly via the DCDU, are prepared on the MCDU. The flight crew selects the appropriate function key (EDIT or MODIFY), on the DCDU, in order to display desired MCDU page (EDIT or MESSAGE MODIFY page). The flight crew enters relevant values and information for the response via the page of the MCDU.
  When desired information is inserted, the flight crew must transfer the information from the MCDU to the DCDU, by pressing appropriate key on the MCDU. Consequently, prepared response message appears on the DCDU.

If the prepared downlink message has more than one page, the flight crew must display, and review all pages of the message on the DCDU, before the message is sent to the ATC. When the flight crew displays all pages of the message, an asterisk (*) appears next to SEND function key of the DCDU. The asterisk (*) indicates that the function key is active, and the function can be used.
If the flight crew cannot answer to an ATC uplink message immediately, a stand-by (STBY) message can be sent to the ATC. When a STBY response message is sent, the message status, displayed on the DCDU, changes to STBY. This message cannot be removed from the DCDU, until the flight crew sends a final response later on.
When a downlink message is successfully sent, the message information area will indicate SENT and the color code of the message will change.

EXAMPLE	Clearance message: The flight crew can answer positively, by selecting WILCO* See (1) and send the message to the ATC, by selecting SEND* See (2) on the DCDU. SENDING appears in the information area of the DCDU, when SEND* is selected. SENT appears in the information area of the DCDU, when the message is successfully sent.

Ident.: DSC-46-10-10-30-00021267.0001001 / 21 MAR 17
Applicable to: ALL

CLOSING AND REMOVAL OF THE MESSAGE FROM THE DCDU

When the flight crew sends the datalink message via the DCDU, The message should be closed, by pressing the CLOSE function key. Closing the message will clean the DCDU screen.

Ident.: DSC-46-10-10-30-00020939.0001001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

The RECALL function key of the DCDU can be used to display the last closed message.
Other messages can be viewed on the MSG LOG page of the MCDU .

Note: *Before each flight, the MSG LOG file of previous flight should be erased.*

Ident.: DSC-46-10-10-30-00020939.0002001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The RECALL function key of the DCDU can be used to display the last closed message.
Other messages can be viewed on the MSG RECORD page of the MCDU.

Note: *Before each flight, the MSG RECORD file of previous flight should be erased.*

Ident.: DSC-46-10-10-30-00021253.0001001 / 21 MAR 17

AUTO-CLOSING

The message closes and the system automatically removes the message from the DCDU, 5 s after the ATC center successfully receives the message.
Clearance messages and messages, related to loss of communication or datalink transmission error, do not close automatically, when sent or received by the ATC. The flight crew must close these messages by pressing the CLOSE key, on the DCDU. Closing the message will remove the message from the DCDU screen.

Intentionally left blank

General

GENERAL

Ident.: DSC-46-10-20-10-00021044.0001001 / 21 MAR 17
Applicable to: ALL

The AOC applications ◁ are datalink applications. The AOC applications enable an exchange of specific messages between the flight crew and the Airline Operational Control (AOC).
The AOC applications are customized by each operator and depend on operator's choices and the datalink service provider.

Note: *Details about AOC applications cannot be provided due to the wide range of customization by the operator.*
Airbus does not supervise customization of AOC applications. It is recommended to insert AOC application description into this chapter in accordance with AOC applications installed on the aircraft.

The AOC application can offer the following functions:

EXAMPLE

- Preflight Functions:
  - Flight log
  - Departure Delay Message
  - Takeoff Delay Message
  - Weather Request
  - NOTAM Request
  - Loadsheet Request
  - Others
- En-Route Functions:
  - Flight log
  - Diversion Message
  - En-route Delay
  - Estimated Time of Arrival (ETA) Message
  - Weather Request
  - NOTAM Request
  - Others
- Postflight Functions:
  - Flight log
  - Flight summary
  - Gate delay
  - Others

The flight crew uses the datalink cockpit interface for the AOC applications.

EXAMPLE	**Flight Plan Modification** This flight plan modification example is based on following assumptions: - The AOC sends a flight plan modification message to the flight crew. - The flight crew loads the fight plan modification in the FMGES, into the secondary F-PLN. - The crew obtains ATC clearance before activating the modified flight plan. - *Refer to DSC-46-10-50 How to Modify FLT Plan* for the flight plan modification based on an AOC request.

Ident.: DSC-46-10-30-10-00021184.0001001 / 21 MAR 17
Applicable to: ALL

The Notification application enables the flight crew to send a notification message to an ATC center, if the datalink system is correctly initialized.
Refer to DSC-46-10-50 How to Initialize for more information about datalink initialization.
The flight crew must notify the ATC center, from 15 min to 45 min, before entering the ATC area.
The flight crew notifies a desired ATC center via the NOTIFICATION page of the MCDU .
However, ATC centers initiate automatic notification, when the aircraft flies from one ATC area to another.

Note: *The ATC center initiates a CPDLC connection, when the flight crew sends the notification. The NOTIFICATION page of the MCDU will display XXXX NOTIFIED HH MM Z). Therefore, it is not necessary to repeat notifications to the ATC center.*

The notification procedure enables the ATC to correlate the aircraft with the ICAO flight number.

Note: *The FMGEC provides the FLT number.*

Consequently, it is essential to enter, into the FMGEC, via the INIT page of the MCDU, the same flight number as the flight number, indicated on the ICAO flight plan (with the same number of letters).
Optional datalink applications ◁ (departure clearance, oceanic clearance and D-ATIS) do not require previous notifications, or connection to an ATC center.

Optional datalink applications are based on voice exchanges:
1. Request - crew requests
2. Clearance - ground clears
3. Read-back - crew reads back
4. Confirmation - ground confirms.

Intentionally left blank

Controller/Pilot Datalink Communication (CPDLC)

GENERAL

Ident.: DSC-46-10-30-20-10-00021177.0001001 / 21 MAR 17
Applicable to: ALL

The CPDLC application enables an exchange of specific ATC messages between the flight crew and air traffic controller.
The air traffic controller initiates the CPDLC connection with the aircraft, after the reception of a notification message from the flight crew.

Note: *When the aircraft flies from one air traffic control area to another, the CPDLC ensures an automatic transfer of ATC centers.*

The flight crew and air traffic controller use a set of predefined messages to build datalink messages. The flight crew and air traffic controller can also send freetext datalink messages. Freetext messages can only be used, when pre-formatted datalink messages do not allow to send the information.

Note: *The freetext message does not allow the datalink system to generate automatic pre-formatted answer.*
The freetext message must contain standard ATC phraseology and standard abbreviations.

The CPDLC application enables the flight crew to answer following uplink messages via the DCDU:
- Clearance
- Report request
- Negotiation message
- Information message.

Ident.: DSC-46-10-30-20-10-00021254.0002001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The CPDLC application supports the following functions:
- Connection (*Refer to DSC-46-10-30-20 Connection*)
- Request (*Refer to DSC-46-10-30-20 Request*)
- Report (*Refer to DSC-46-10-30-20 Report*)
- Message Modify (*Refer to DSC-46-10-30-20 Message Modify*)
- MAX Uplink Delay (*Refer to DSC-46-10-30-20 Max Uplink Delay*)
- Emergency (*Refer to DSC-46-10-30-20 Emergency*).

Ident.: DSC-46-10-30-20-10-00021254.0001001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

The CPDLC application supports the following functions:
- Connection (*Refer to DSC-46-10-30-20 Connection*)
- Request (*Refer to DSC-46-10-30-20 Request*)

- Report (*Refer to DSC-46-10-30-20 Report*)
- Message Modify (*Refer to DSC-46-10-30-20 Message Modify*)
- Emergency (*Refer to DSC-46-10-30-20 Emergency*).

CONNECT

Ident.: DSC-46-10-30-20-00021178.0001001 / 21 MAR 17
Applicable to: ALL

The notified ATC center can initiate a CPDLC connection with the aircraft. This ATC center is then considered as active. The active ATC center appears on the DCDU, and on the MCDU, in the active ATC field of the CONNECTION STATUS page.
Only one ATC center can be active at a time.
During flight, the aircraft may move from one ATC area to another ATC area. The next ATC may anticipate this change. The next ATC center may initiate a passive connection with the aircraft, when the aircraft is still connected to the active ATC. In this case, the next ATC center appears on the DCDU, and on the MCDU, in the next ATC field of the CONNECTION STATUS page. When the ATC area changes, the active ATC center ends the connection with the aircraft, and the next ATC center automatically becomes the active ATC center.
The CONNECTION STATUS page of the MCDU displays ICAO codes of both, the active and the next (if any) ATC centers. The flight crew can manually disconnect the ATC centers via the CONNECTION STATUS page.
Refer to DSC-46-10-40-30 CONNECTION STATUS for information about the CONNECTION STATUS page.

REQUEST

Ident.: DSC-46-10-30-20-00021179.0001001 / 28 NOV 17
Applicable to: ALL

The flight crew can request a clearance or information from the air traffic controller.
The MCDU enables the flight crew to create:

- Lateral Request
  The flight crew can prepare request messages associated with lateral trajectory changes on the ATC LAT REQ page.
- Vertical Request
  The flight crew can prepare request messages associated with vertical trajectory changes on the ATC VERT REQ page.

- WHEN CAN WE EXPECT Request
  The flight crew can prepare negotiation messages associated with altitude or speed flight parameters on the WHEN CAN WE EXPECT page.
- Other Request
  The flight crew can prepare messages to request clearance, own separation and voice contact on the ATC OTHER REQ page.

The flight crew can add a freetext to a request if a justification is required, or the pre-formatted layout of message does not enable to send the information.

Note: *Requests of the departure clearance, oceanic clearance and ATIS are not part of the CPDLC application.*

POSITION REPORT

Ident.: DSC-46-10-30-20-00021180.0001001 / 21 MAR 17
Applicable to: ALL

The REPORT function provides ATC with information about the aircraft position, trends (climb, speed, descent, heading, track,) and other requested parameters.
The flight crew prepares report messages on the MCDU, on the ATC REPORTS page.
The ATC REPORTS page enables the flight crew to:

- Set position report messages
- Access BACK-ON-ROUTE REPORT page
- Modify REPORT messages
- Create a freetext message
- Add freetext to a report message

When the flight crew positively answers report request, the FMGEC monitors associated parameters. As a result, the DCDU displays a reminder message, when monitored parameter satisfies the condition.
When the flight crew positively answers deferred clearance or conditional clearance message, the DCDU displays a reminder message before the clearance expiry.

POSITION REPORT

The flight crew reports position, when requested, and/or when the waypoint is sequenced.
The flight crew can report the aircraft position to the active ATC center manually, or automatically:

- MANUAL POS REPORT
  The flight crew prepares the manual position report, on the POSITION REPORT page.
  Mandatory and optional parameters of the position report can be filled by FMGES, or the flight crew.
- AUTO POS REPORT
  Position report message appears on the DCDU, if waypoints are sequenced correctly in the FMGES.
  The flight crew may activate the automatic position report on the ATC REPORTS page.

Note: *Independently from the CPDLC position reporting, the ADS-C also reports the aircraft position automatically.*

BACK ON ROUTE

The flight crew may deviate from a clearance to fly an initial route, due to offset route or weather.
The flight crew sends back-on-route message to the air traffic controller, when the initial route is resumed.

Note: *The FMGEC cannot monitor the back-on-route situation.*

MSG MODIFY

Ident.: DSC-46-10-30-20-00021181.0001001 / 04 JUN 19
Applicable to: ALL

The Message Modify function enables the flight crew to modify automatic replies that the CPDLC generates, in accordance with specific requests from the ATC.

Via the DCDU, the CPDLC application may automatically propose a response to:
- Confirm request (position, speed, heading, altitude, ...)
- Report request (position reports, altitude, ...)
- Open negotiation request (When can you accept altitude, speed, ...?)
- A combination of the above requests.

The MESSAGE MODIFY page appears automatically on the MCDU if the MODIFY function key is pressed on the DCDU and the corresponding MCDU displays an ATC page.

Note: *Pressing MODIFY also triggers MCDU FOR MODIF/MCDU FOR EDIT indication, in the message information area, on the DCDU.*

When the flight crew opens the MESSAGE MODIFY page for the first time, all modifiable fields are automatically updated with FMGES data.
The flight crew can add a freetext to the message, if a justification is required, or if a specific additional information is requested by the air traffic controller.
Refer to DSC-46-10-40-20 Message Information Area for information about indications on the DCDU.

Refer to DSC-46-10-40-30 MSG MODIFY for information about MESSAGE MODIFY page.

MAX UPLINK DELAY

Ident.: DSC-46-10-30-20-00021182.0002001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Max Uplink Delay function enables the ATC datalink to reject (without a notice to the flight crew) any CPDLC uplink messages, if the delay between ground emission and onboard reception exceeds the time, specified in the MAX UPLINK DELAY of the MAX UPLINK DELAY page on the MCDU.
The max uplink delay is the maximum delay that is authorized for an ATC answer. By default, the value of the max uplink delay is set to NONE. This setting means that datalink messages are not rejected, due to a too long transmission time.
The air traffic controller defines the value of the maximum uplink delay. The ground system can automatically uplink the value of the delay in a specific freetext message.
On the ATC request, the flight crew must modify the maximum uplink delay value via the MAX UPLINK DELAY page on the MCDU.

CAUTION	Do not enter any value in the MAX UPLINK DELAY entry field unless requested by the air traffic controller.

Note: *The MAX UPLINK DELAY value is reset to NONE, when the connection with the current active ATC center ends.*
If the flight crew receives a message CONFIRM MESSAGE LATENCY TIMER OFF, the flight crew must check that the MAX UPLINK DELAY value is equal to NONE. If the MAX UPLINK DELAY value is no set to NONE, the MAX UPLINK DELAY value must be cleared.

Refer to DSC-46-10-40-30 MAX UPLINK DELAY for more information about MAX UPLINK DELAY page.

EMERGENCY

Ident.: DSC-46-10-30-20-00021183.0001001 / 21 MAR 17
Applicable to: ALL

The EMERGENCY page enables the flight crew to:
- Create an emergency datalink message
- Activate the ADS-C Emergency.

The flight crew can switch the ADS-C to emergency mode manually via the EMERGENCY page of the MCDU,
The ADS-C switches to the emergency mode automatically, when the flight crew sends a MAYDAY message.

The flight crew can add a freetext to the emergency message, if additional information can be provided.

Automatic Dependent Surveillance-Contract (ADS-C)

ADS-CONTRACT

Ident.: DSC-46-10-30-30-00021176.0002001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Automatic Dependent Surveillance – Contract (ADS-C) application provides information and surveillance data reports to one or more connected ATC centers. This activity is automatic and transparent to the flight crew.

Note: *Therefore, the ADS-C reporting does not require a flight crew action, datalink notification, and/or an initiation of CPDLC application.*

The air traffic controller defines the content and the frequency of the reports.
The ATC center initiates the ADS-C connection provided that, the ADS-C status of the aircraft is armed or connected. The flight crew can check the status of ADS-C on the MCDU, on the CONNECTION STATUS page.

The ADS-C may have the following status:
- Armed
  The ADS-C function is armed by default. If the ADS-C is armed, up to 5 ATC centers can connect. Connection is at the ATC's discretion. When one ATC center is connected, the ADS-C status changes from armed to connected.
- Connected

  When an ATC center is connected to the ADS-C:
  - The CONNECTION STATUS page, on the MCDU indicates the connected status of the ADS-C
  - The ADS-C DETAIL page/ADS DETAIL page, on the MCDU provides a list of all ADS-C connected centers
  - The DCDU indicates the number of ADS-C connected centers in the DCDU default screen.
- Off
  All active ADS-C connections stop, and the ADS-C connection cannot be established from the ground, by ATC center.
  The flight crew can set the ADS-C to off via the CONNECTION STATUS page.

  Note: *The ADS-C should not be turned off, unless the flight crew is instructed to do so (for example, via an ATC request).*

ADS-CONTRACT

Ident.: DSC-46-10-30-30-00021176.0001001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

The Automatic Dependent Surveillance – Contract (ADS-C) application provides information and surveillance data reports to one or more connected ATC centers. This activity is automatic and transparent to the flight crew.

Note: Therefore, the ADS-C reporting does not require a flight crew action, datalink notification, and/or an initiation of CPDLC application.

The air traffic controller defines the content and the frequency of the reports.
The ATC center initiates the ADS-C connection provided that, the ADS-C status of the aircraft is armed or connected. The flight crew can check the status of ADS-C on the MCDU, on the CONNECTION STATUS page.

The ADS-C may have the following status:

- On
  The ADS-C function is set on by default. An ATC center can connect.
- Off
  All active ADS-C connections stop, and the ADS-C connection cannot be established from the ground, by ATC center.
  The flight crew can set the ADS-C to off via the CONNECTION STATUS page.

  Note: The ADS-C should not be turned off, unless the flight crew is instructed to do so (for example, in an ATC request).

Departure Clearance (DCL)

DEPARTURE CLEARANCE

Ident.: DSC-46-10-30-40-00021175.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Departure Clearance (DCL) application enables the flight crew to request and obtain departure information and clearance from the ATC center.

The DCL application is initiated by:
- The flight crew, when sending a DCL request
  Refer to DSC-46-10-50 Request for information about how to request DCL.
- The ATC center, when sending a DCL clearance to the aircraft without a request.

Consequently, the flight crew receives the clearance, reads back the clearance and receives the read-back confirmation from the ATC.

DEPARTURE CLEARANCE RECEPTION

A new message triggers visual (ATC MSG light) and aural alerts. The DCDU displays the new message in an open status, on a blue background.
Refer to DSC-46-10-50 Reception for information about how to receive DCL.

DEPARTURE CLEARANCE READ-BACK

The flight crew can acknowledge or refuse the departure clearance.
Refer to DSC-46-10-50 Read-Back for information about how to read-back DCL.

DEPARTURE CLEARANCE READ-BACK CONFIRMATION

A new read-back confirmation message triggers visual (ATC MSG light) and aural alerts.
Refer to DSC-46-10-50 Confirmation of DCL Read-Back for information about how to read-back DCL confirmation.

Intentionally left blank

Oceanic Clearance (OCL)

OCEANIC CLEARANCE

Ident.: DSC-46-10-30-50-00021174.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Oceanic Clearance (OCL) application enables the flight crew to request and obtain an oceanic clearance from the Oceanic ATC center, before entering an oceanic airspace.

The OCL application can be initiated by:
- The flight crew, when sending an OCL request via the MCDU
  Refer to DSC-46-10-50 Request for information about how to request OCL.
- The ATC center, when sending an OCL clearance to the aircraft without a request.

Consequently, the flight crew receives the clearance, reads back the clearance and receives the read-back confirmation from the ATC.

OCEANIC CLEARANCE RECEPTION

A new message triggers visual (ATC MSG light) and aural alerts. The DCDU displays the new message in an open status, on a blue background.
Refer to DSC-46-10-50 Reception for information about how to receive OCL.

OCEANIC CLEARANCE READ-BACK

The flight crew can acknowledge or refuse the oceanic clearance.
Refer to DSC-46-10-50 Read-Back for information about how to read-back OCL.

OCEANIC CLEARANCE READ-BACK CONFIRMATION

A new read-back confirmation message triggers visual (ATC MSG light) and aural alerts.
Refer to DSC-46-10-50 Confirmation of OCL Read-Back for information about how to read-back OCL confirmation.

Intentionally left blank

Digital-Automatic Terminal Information System (D-ATIS)

DIGITAL - ATIS

Ident.: DSC-46-10-30-60-00021173.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Digital Automatic Terminal Information Service (D-ATIS) enables the flight crew to request and obtain information about airports.

Note: *The D-ATIS may not be available for all airports. Terminal charts usually indicate when the D-ATIS is available.*

The flight crew can request information for departure, destination, and alternate airports via the ATIS MENU page of the MCDU.
When initially accessing the ATIS MENU page, the application automatically fills in the airport names and type of the ATIS areas with departure, arrival and alternate airport names (if they are entered via the FMS). The departure type indicator (DEP) is automatically associated to the departure airport request. The arrival type indicator (ARR) is automatically associated to the destination and the alternate airport requests.
To make a request for another airport than the one automatically filled, enter the ICAO code of the airport in one of the areas.

The flight crew requests ATIS reports:
- Manually
  Refer to DSC-46-10-50 Manual Request for more information.
- Automatically
  Refer to DSC-46-10-50 Auto-Update Request for more information.

The AUTO-UPDATE function automatically provides ATIS reports of arrival airports only when a new version is available.
The AUTO-UPDATE CANCEL function enables to deactivate the AUTO-UPDATE function.

Note: *Once the auto-update function is cancelled, the REQ SEND function, related to the arrival airport, becomes available. The flight crew can still send an ATIS report request to the related arrival airport manually.*

The flight crew receives ATIS reports on:

- The MCDU,
  Refer to DSC-46-10-50 Reception for more information about a display of received ATIS.

  Note: *ATIS reports are received in the MCDU, contrary to other ATC datalink applications that receive messages in the DCDU.*
- The printer
  When the automatic print is selected on the ATIS MENU page, the ATIS information is sent directly to the printer.

Message Record

MESSAGE RECORD

Ident.: DSC-46-10-30-70-00021172.0002001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Message Record application enables to store datalink messages. The flight crew can display the recorded messages at any time.
When the flight crew closes a message on the DCDU, the message is stored and disappears from the DCDU.
The messages are stored in chronological order and grouped by flight number. When the maximum number of stored messages is reached (up to 99 messages), any new message will be stored and the oldest message will be deleted.
The flight crew can access the stored message via the MSG RECORD page of the MCDU.

Note: *1. The flight crew can print recorded messages.*
2. The flight crew can erase all recorded messages.
3. The ADS-C ◁ reports are not stored.

MESSAGE RECORD/LOG

Ident.: DSC-46-10-30-70-00021172.0001001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

The Message Log application enables to store datalink messages. The flight crew can display the recorded messages at any time.
When the flight crew closes a message on the DCDU, the message is stored and disappears from the DCDU.
The messages are stored in chronological order and grouped by flight number. When the maximum number of stored messages is reached (up to 99 messages), any new message will be stored and the oldest message will be deleted.
The flight crew can access stored message via the MSG LOG page of the MCDU.

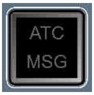
Note: *1. The flight crew can print recorded messages.*
2. The flight crew can erase all recorded messages.
3. The ADS-C ◁ reports are not stored.

Intentionally left blank

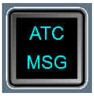
ATC Message Pushbutton (ATC MSG PB)

ATC MSG PB

Ident.: DSC-46-10-40-10-00021073.0001001 / 21 MAR 17
Applicable to: ALL



No datalink message from the ATC center was received.



Flashes when a datalink message from the ATC center is received, or a reminder message is received. When a message is received, the DCDU automatically displays the message on the screen.
Associated with audio alert.
When the flight crew presses one of the two ATC MSG pbs, the ATC MSG lights go off and the aural alert associated with the reception of the message is cancelled.

Intentionally left blank

Datalink Control and Display Unit (DCDU)

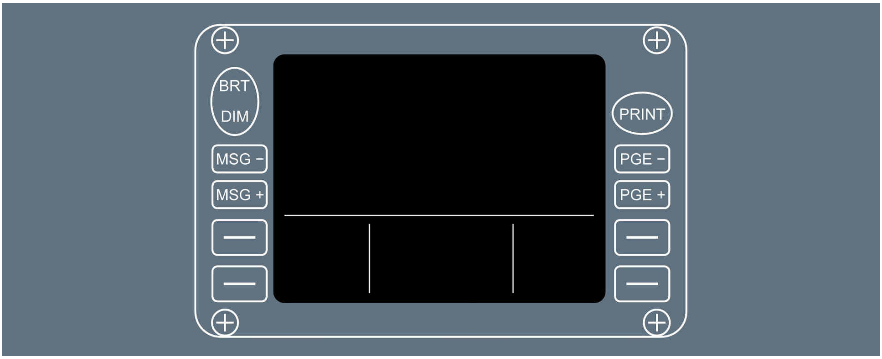
DCDU

Ident.: DSC-46-10-40-20-10-00021072.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

- **If datalink connection is not established:**

  By default, the DCDU displays no information. The DCDU screen is black without information.

DCDU Screen with No Datalink Connection



- **If datalink connection is established:**
  - **If no datalink message is displayed on the DCDU:**

    By default, the DCDU displays:
    - ACTIVE ATC and the active ATC ICAO code
    - NEXT ATC and the next ATC ICAO code, if the active ATC initiated an automatic transfer to a next ATC
    - ADS-C status, when the ADS-C is set to OFF
    - ADS-C CONNECTED (X), if an ADS-Contract ◁ is established with ATC center(s)
      (X) : Displays the number of ADS-C active connections, when at least one ATC center is connected
    - NO ATC DLK/ATC DISCONNECTED, when the datalink connection is lost.

EXAMPLE	The DCDU default screen, when the datalink is connected and no message is displayed on the screen:

DATALINK MESSAGE AREA

Displays uplink and downlink messages.

Uplink messages are displayed on a black background, and:
- When received, the message appears in white and the main parameters in cyan.
- When answered, the message becomes green.
- When monitored, a parameter appears in magenta (This indicates that the FMGES monitors this parameter).
  If the monitoring fails, this parameters become amber.
  When the value is attained, this parameter becomes green.
- If the loading of the clearance in the secondary flight plan fails, parameters appear in amber.

Downlink messages appear in black:
- On a cyan background before sending
- On a green background while and after sending.

Ident.: DSC-46-10-40-20-10-00021164.0001001 / 21 MAR 17
Applicable to: ALL

MESSAGE STATUS

Indicates the status of the message or the response of the flight crew to a message received from the active ATC center.

 AFFIRM	The status of the message changes to AFFIRM, when the flight crew selects a positive answer to the ATC uplink message on the DCDU.
 AFFIRM	The status of the message changes to AFFIRM, when the flight crew sends a positive answer to the ATC center.
 NEGATV	The status of the message changes to NEGATV, when the flight crew selects a negative answer to the ATC uplink message on the DCDU.
 NEGATV	The status of the message changes to NEGATV, when the flight crew sends a negative answer to the ATC center.
 ROGER	The status of the message changes to ROGER, when the flight crew selects ROGER, in order to inform the ATC center that they received and understood the uplink message.
 ROGER	The status of the message changes to ROGER, when the flight crew sends a ROGER answer to the ATC center.
 STBY	The status of the message changes to STBY, when the flight crew selects STBY, in order to inform the ATC center that they need time to answer the uplink message.
 STBY	The status of the message changes to STBY, when the flight crew sends a STBY answer to the ATC center.

UNABLE

The status of the message changes to UNABLE, when the flight crew selects UNABLE, in order to inform the ATC center that they cannot comply with the request.

UNABLE

The status of the message changes to UNABLE, when the flight crew sends a UNABLE answer to the ATC center.

WILCO

The status of the message changes to WILCO, when the flight crew selects WILCO, in order to inform the ATC center that they understood the request and that they will comply with it.

WILCO

The status of the message changes to WILCO, when the flight crew sends a WILCO answer to the ATC center.

OPEN

Indicates that the received uplink message requires a response. The status OPEN remains until the flight crew answers the uplink message.

OPEN

Indicates that:

- The flight crew did not answer the uplink message in due time, or
- The flight crew sent a downlink or a response message, but no acknowledgment from the ground was received.

ABORT

Indicates that a disconnection occurred during a pending uplink or downlink message.

Note: *The status field remains empty for:*
- *A downlink message sent to the active ATC center*
- *An uplink message for which no response is expected.*

Ident.: DSC-46-10-40-20-10-00021165.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

ACK

The status of the message changes to ACK, when the flight crew selects ACK, in order to acknowledge a departure/oceanic clearance.

ACK

The status of the message changes to ACK, when the flight crew sends a ACK answer to the ATC center.

REFUSE

The status of the message changes to REFUSE, when the flight crew selects REFUSE, in order to refuse a departure/oceanic clearance. The message CONTACT ATC BY VOICE - REFUSE NOT SUPPORTED - BY DATALINK appears in the datalink message area, in order to inform the flight crew that they must use voice radio communication to refuse the clearance.

Ident.: DSC-46-10-40-20-10-00021166.0003001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

FUNCTION KEYS

Depending on the nature of the message, the system automatically displays an appropriate function by each function key.

Possible unctions are detailed below.

AFFIRM : When selected, prepares an affirmative response to accept an ATC negotiation message (e.g. CAN YOU ACCEPT [altitude] AT [time]).

CANCEL : When selected, enables the flight crew to:
- Remove a prepared downlink message from the DCDU
- Cancel a selected reply to an uplink message.

CANNOT : When selected, prepares a negative answer to an OPEN negotiation message from the ATC.

CLOSE : When selected, erases a message (from the DCDU screen) that was sent to the ATC, or erases a message from the ATC that was answered. This message is stored in the MSG RECORD. This is not applicable when the answer is on stand-by (STBY).

LOAD : When selected, loads a flight plan from the ATC, or a parameter time constraint, into the secondary flight plan.

MODIFY : When selected, accesses the MESSAGE MODIFY page or POSITION REPORT page on the MCDU, in order to modify a message proposed by the FMGES. MODIFY also enables to update parameters that the FMGES provides to the DCDU.

NEGATV : When selected, prepares a negative response to an ATC message.

RECALL : When selected, recalls the most recently closed message if it was closed within the last 5 min. If the flight crew selects the RECALL more than 5 min after the last message was closed, the following message appears:

RECALL EMPTY
CONSULT MSG RECORD

ROGER : When selected, confirms the reception, and understanding of ATC information or report request.

SEND : When selected, sends a message or an answer, that was prepared by using other function keys (Example: WILCO, ROGER, AFFIRMATIVE, STBY, ...).

STBY : When selected, informs the ATC that the flight crew needs to delay the answer.

UNABLE : When selected, rejects an ATC clearance.

WILCO : When selected, accepts an ATC clearance.

* : The function keys are operative, if an asterisk or a function is visible.

Ident.: DSC-46-10-40-20-10-00021166.0001001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

FUNCTION KEYS

Depending on the nature of the message, the system automatically displays an appropriate function by each function key.

Possible unctions are detailed below.

AFFIRM : When selected, prepares an affirmative response to accept an ATC negotiation message

ANSWER : When selected, splits a datalink message, including several questions, into different messages.

CAN : When selected, prepares a positive answer to an OPEN negotiation message from the ATC (Ex: When can you.... ?).

CANCEL : When selected, enables the flight crew to:
- Remove a prepared downlink message from the DCDU
- Cancel a selected reply to an uplink message.

CANNOT : When selected, prepares a negative answer to an OPEN negotiation message from the ATC.

CLOSE : When selected, erases a message (from the DCDU screen) that was sent to the ATC, or erases a message from the ATC that was answered. This message is stored in the MSG LOG. This is not applicable when the answer is on stand-by (STBY).

LOAD : When selected, loads a flight plan from the ATC, or a parameter time constraint, into the secondary flight plan.

MODIFY : When selected, accesses the MESSAGE MODIFY page or POSITION REPORT page on the MCDU, in order to modify a message proposed by the FMGES. MODIFY also enables to update parameters that the FMGES provides to the DCDU.

NEGATV : When selected, prepares a negative response to an ATC message.

OTHER : When selected, displays the other functions that could be applicable to the current message, but are not currently displayed.

RECALL : When selected, recalls the last message that was removed from the screen, using the CLOSE function.

ROGER : When selected, confirms the reception, and understanding of ATC information or report request.

SEND : When selected, sends a message or an answer, that was prepared by using other function keys (e.g.: WILCO, ROGER, AFFIRMATIVE, STBY, ...).

STBY : When selected, informs the ATC that the flight crew needs to delay the answer.

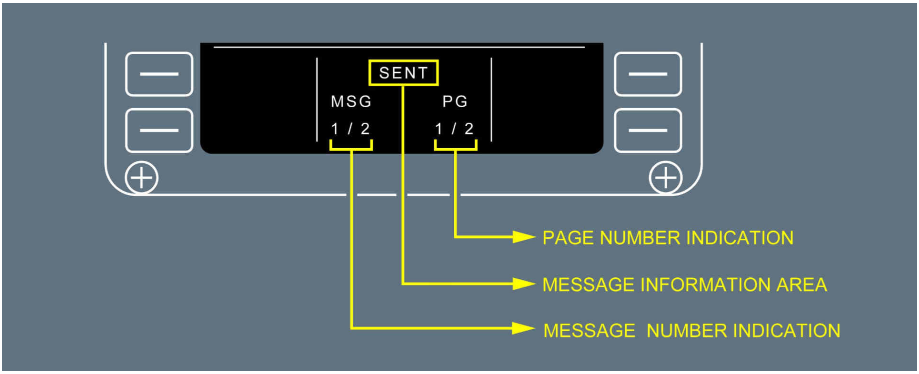
UNABLE : When selected, rejects an ATC clearance.

WILCO	:	When selected, accepts an ATC clearance.
*	:	The function keys are operative, if an asterisk or a function is visible.

Ident.: DSC-46-10-40-20-10-00021167.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

ACK	:	When selected, prepares a response message to accept a departure/oceanic clearance message.
REFUSE	:	When selected, prepares a response message to send a negative answer to a departure/oceanic clearance message.

Ident.: DSC-46-10-40-20-10-00021168.0002001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU



MESSAGE NUMBER INDICATION

Indicates the rank of the message that is displayed on the DCDU.
If there is only one message on the DCDU, the message number information does not appear in the information field. In the case of a new message reception, the message number indication flashes.

PAGE NUMBER INDICATION

Indicates the page number of the message that is displayed on the DCDU.
If the message contains only one page, the page number information does not appear in the information field.

MESSAGE INFORMATION AREA

ANSWER MSG (amber)	:	The maximum number of pending uplink messages is reached.
COM FAULT (amber)	:	The communication means are faulty.

COM NOT AVAIL (amber)	:	The communication means are temporarily not available.
COM NOT INIT (amber)	:	The router is not initialized.
CHECK CLRCE (amber)	:	The response for a positive reminder of a deferred clearance is lost.
FILE FULL (amber)	:	The maximum number of downlink messages, accessible on the DCDUs, is reached.
LINK LOST (amber)	:	The data link connection is abnormally lost.
LOAD FAILED (amber)	:	The loading of the flight plan, contained in the current message, has failed.
LOAD PARTIAL (amber)	:	The loading of the flight plan, contained in the current message, was only partially done.
LOAD SEC OK (white)	:	The loading of the flight plan, contained in the current message, is successful.
LOADING SEC (white)	:	The flight plan, or time constraint, contained in the current message is being loaded in the secondary flight plan of the FMGES.
LOAD UNAVAIL (amber)	:	The loading is not possible.
MCDU FOR TEXT (white)	:	A negative answer for a pending uplink message is initiated.
MCDU FOR MODIF (white)	:	The current message is in modification on the MCDU.
MONIT CNCLD (white)	:	The FMGES monitoring is cancelled.
MONIT FAILED (amber)	:	The requested FMGES monitoring failed to start.
MONIT LOST (amber)	:	The FMGES monitoring is lost.
MONIT UNAVAIL (amber)	:	The FMGES monitoring is not possible.
MONITORING (white)	:	The FMGES monitors the parameter of the current message.
NO ATC REPLY (amber)	:	The ATC center did not answer to the request within 7 min 30 s.
NO FM DATA (white)	:	The FMGES is not able to provide the ATC requested parameters.
NO MORE MSG (white)	:	The minimum/maximum number of accessible messages is reached.
NO MORE PGE (white)	:	The minimum/maximum number of accessible pages is reached.

OVERFLW CLOSED (amber) : The maximum number of non-pending messages is reached, and a new non-pending message is stored in the file.

PARTIAL DATA (white) : The FMGES cannot provide all the ATC requested parameters.

PRINT FAILED (amber) : The printing was requested from the DCDUs and the printing failed.

PRINT UNAVAIL (white) : The printing was requested from the DCDUs, while the printer is not available.

PRINTING (white) : The printing was requested from the DCDUs and the printing is in progress.

RECALL MODE (white) : The last closed message from the DCDU is recalled, if the flight crew presses the "RECALL key" within the last 5 min of the message closure.

REMINDER (white) : The current message was automatically recalled by the FMGES.

SEND FAILED (amber) : The transmission of a reply to an uplink message or of a downlink is not successful.

SENDING (white) : The sending of the current message is in progress.

SENT (white) : The current message was sent.

WAIT FM DATA (white) : The FMGES is preparing an answer to the ATC’s request for navigation parameters.

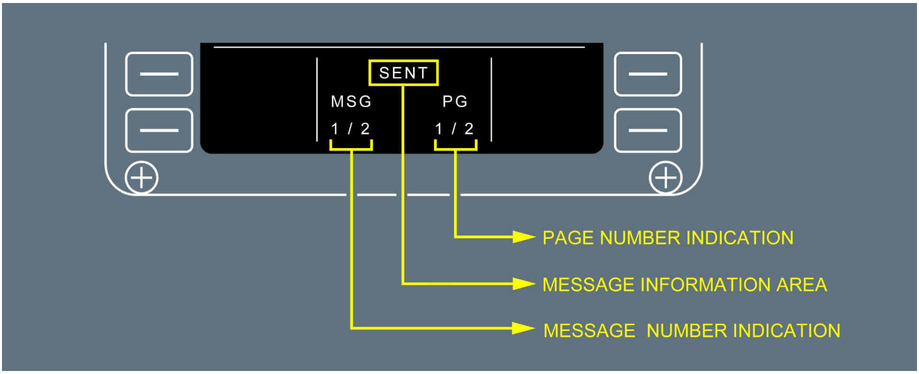
Message Information Area on the DCDU



MESSAGE NUMBER INDICATION

Indicates the rank of the message that is displayed on the DCDU.
If there is only one message on the DCDU, the message number information does not appear in the information field. In the case of a new message reception, the message number indication flashes.

PAGE NUMBER INDICATION

Indicates the page number of the message that is displayed on the DCDU.
If the message contains only one page, the page number information does not appear in the information field.

MESSAGE INFORMATION AREA

ANSWER MSG (amber) :	Maximum number of pending uplink messages is reached.
FILE FULL (amber) :	Maximum number of downlink messages, accessible on the DCDUs, is reached.
DOWNLINK LOST (amber) :	Transmission of a request is unsuccessful.
LINK LOST (amber) :	Communication with the ATC is unavailable (displayed on any message pending when the loss occurred).
LOAD FAILED (amber) :	The loading of the flight plan, contained in the current message, has failed.

LOAD OK (white)	:	The loading of the flight plan, contained in the current message, was successful.
LOAD PARTIAL (amber)	:	The loading of the flight plan, contained in the current message, was only partially done.
LOAD UNAVAIL (amber)	:	Loading is not possible.
LOADING (white)	:	The flight plan, or time constraint, contained in the current message is being loaded in the secondary flight plan of the FMGES.
MCDU FOR MODIF (white)	:	Follows pressing of the “MODIFY key.
MCDU FOR TEXT (white)	:	Initiation of a negative answer for a pending uplink message.
MONIT CNCLD (white)	:	FMGES monitoring is cancelled.
MONIT FAILED (amber)	:	FMGES monitoring was requested, but failed to start.
MONIT LOST (amber)	:	FMGES monitoring is lost.
MONIT UNAVAIL (amber)	:	FMGES monitoring is not possible.
MONITORING (white)	:	The FMGES is monitoring the parameter of the current message.
NO ATC REPLY (amber)	:	No answer received within 5 min.
NO FM DATA (white)	:	The FMGES is unable to provide the ATC-requested parameters.
NO MORE MSG (white)	:	Follows pressing of the “MSG + “ or “MSG - key, when no more messages are accessible.
NO MORE PGE (white)	:	Follows pressing of the “PGE + or “PGE - key, when no more pages are accessible.
OVERFLW STORED (white)	:	Maximum number of non-pending messages is reached, and a new non-pending message is registered in the file.
PRINT FAILED (amber)	:	Printing was requested from the DCDUs and printing failed.
PRINTING (white)	:	Printing was requested from the DCDUs and printing is in progress.
PRINTING UNAVAIL (white)	:	Printing was requested from the DCDUs, but the printer is unavailable.
RECALL MODE (white)	:	Recalls the last stored message.
REMINDER (white)	:	The current message was automatically recalled by the FMGES.
RESPONSE LOST (amber)	:	Transmission of a reply to an uplink message is unsuccessful.

SENDING (white)	:	The current message is being sent.
SENT (white)	:	The current message was sent.
WAIT FM DATA (white)	:	The FMGES is preparing an answer to the ATC's request for navigation parameters.

Ident.: DSC-46-10-40-20-10-00021169.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

NON STD FORMAT (white)	:	The received uplink for OCL/DCL is partially valid.
NON STD SENDER (white)	:	The received uplink for OCL/DCL is partially valid because the identification of the ATC center is not possible.

Ident.: DSC-46-10-40-20-10-00021170.0002001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

TIME

Indicated time corresponds to the UTC time of:
- *Uplink message*, when the ATC center sent the message.
- *Downlink message*, when the flight crew sent the message to the ATC center.

Note: *If the time when the ATC center sent the message is not available:*
- *No time appears in the TIME area*
- *The "(RECEIVED AT XXXXZ) indication appears at the end of the message, where XXXX is the reception time of the uplink message*
- *If the clock fails, the time area in the answer to an uplink is empty if no time stamp was previously available.*

Ident.: DSC-46-10-40-20-10-00021170.0001001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

TIME

Indicated time corresponds to the time when the DCDU receives the message from the ATC or the FMGES.

Ident.: DSC-46-10-40-20-10-00021171.0001001 / 21 MAR 17
Applicable to: ALL

BRT/DIM KEY

Adjusts the brightness of the DCDU

DESTINATION/ORIGIN ATC CENTER

Indicates the active ATC center that sent or received the message.

MESSAGE SCROLL KEY (MSG- / MSG+)

When pressed, displays the previous/next message in the file.

NEXT/PREVIOUS PAGE KEYS (PGE- / PGE+)

When pressed, displays the previous/next page of the message, if the message cannot be displayed on one single page.

PRINT KEY

Prints the message that is currently displayed on the DCDU.

Intentionally left blank

<RETURN            REQ DISPL*
```

[1L] ATC FLT NBR	The ATC flight number is automatically displayed by the system. The ATC flight number may be modified on the FMS INIT page.
[2L] FROM/TO	The departure and arrival airports are automatically displayed by the system, and may be modified by the flight crew. The departure request will be sent only to the departure airport.
[3L] GATE	Enters the departure gate number or the airport stand position.
[4L] FREE TEXT	Enters a free text.
[6L] ATC MENU RETURN	When selected, the MCDU displays the ATC MENU page.
[1R] A/C TYPE	The aircraft type is automatically displayed by the system, and may be modified by the flight crew.
[3R] ATIS CODE	Enters the ATIS code. If the flight crew received an ATIS uplink message, the code of this message is displayed automatically .
[5R] MORE FREE TEXT	When selected, the MCDU displays the TEXT page, in order to add more free text in the message.
[6R] ATC DEPART REQ DISPLAY	When selected, the DCDU displays prepared departure request.

EMERGENCY

[1L] MAYDAY	Generates a downlink message that indicates a critical failure on board.
[2L] PANPAN	Generates a downlink message that indicates a major failure on board.
[4L] VOICE CONTACT	Requests voice contact with the ATC. The default frequency is 121.5 MHz.
[5L] ALL FIELDS ERASE	Erases all data that were entered on the page, and erases the data that were entered on other associated pages.
[6L] ATC MENU RETURN	When selected, the MCDU displays the ATC MENU page.
[1R] SET OFF or SET ON	Activates, or deactivates the ADS-C emergency mode. The title line displays the mode status: - EMERG ADS-C: ON, when the mode is activated - EMERG ADS-C:OFF, when the mode is not activated.
[2R] DESCENDING TO	Displays the FCU-selected altitude of the descent.
[3R] DIVERTING/VIA	Enters the route, or airport, the aircraft is diverting to.
[4R] FREQ	Enters the requested voice frequency of voice contact with the ATC.
[5R] ADD TEXT	When selected, the MCDU displays the TEXT page. ADD TEXT activates, while a message is being created.
[6R] ATC EMERG DISPL	When selected, the DCDU displays prepared emergency message.

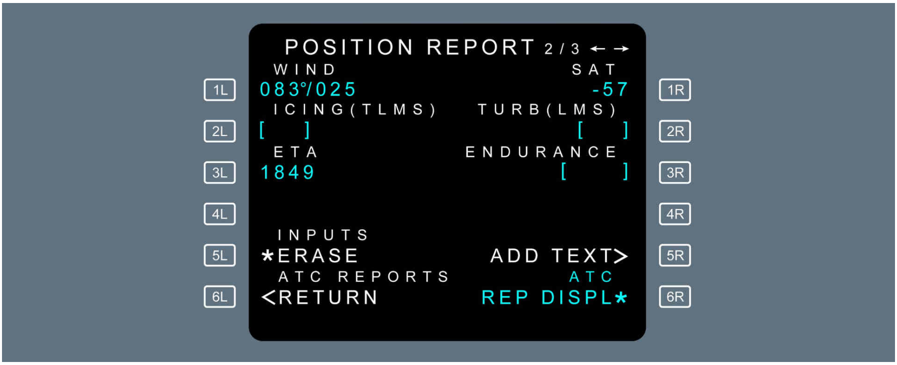
Note: The FMGES automatically fills the data into all fields. The pilot can overwrite these data.

[1L] OVHD	Displays the last-reported waypoint. OVHD corresponds to the last-sequenced waypoint.
[2L] PPOS	Displays the aircraft's present position.
[3L] TO	Displays the TO waypoint of the flight plan.
[4L] NEXT	Displays the NEXT waypoint of the flight plan.
[5L] INPUTS ERASE	Erases all data that were entered on the page, and erases data that were entered on other associated pages.
[6L] ATC REPORTS RETURN	When selected, the MCDU displays the ATC REPORTS page.
[1R] UTC/ALT	Displays the time and altitude at the last-reported waypoint.
[2R] UTC/ALT	Displays the time and altitude at the aircraft's present position.
[3R] UTC	Displays the predicted time of arrival at the following waypoint.
[5R] ADD TEXT	When selected, the MCDU displays the TEXT page. ADD TEXT is active, while a message is being created.
[6R] ATC REP DISPL	When selected, the DCDU displays prepared message.

POSITION REPORT PAGE 2/3



```
POSITION REPORT 2/3 ←→
 WIND                       SAT

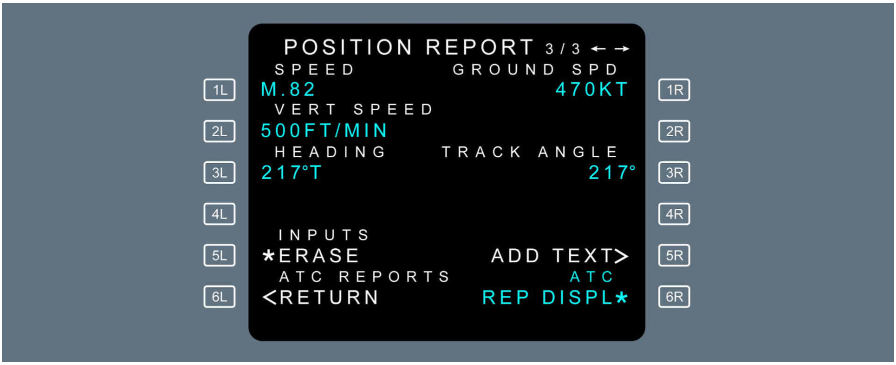
*ERASE                ADD TEXT>
 ATC REPORTS                ATC
<RETURN             REP DISPL*
```

Note: *The FMGES automatically fills the data into fields of Wind, ETA, and SAT. The pilot can overwrite these data.*

[1L] WIND	Displays the current wind (speed and direction).
[2L] ICING (TLMS)	Enters the level of icing: - T for Trace icing - L for Light icing - M for Moderate icing - S for Severe Icing.
[3L] ETA	Displays the Estimated Time at Arrival.
[5L] INPUTS ERASE	Erases all data that were entered on the page, and erases data that were entered on other associated pages.
[6L] ATC REPORTS RETURN	When selected, the MCDU displays the ATC REPORTS page.
[1R] SAT	Displays the Static Air Temperature (SAT).
[2R] TURB (LMS)	Enters the level of turbulence: - L for Light turbulence - M for Moderate turbulence - S for Severe turbulence.
[3R] ENDURANCE	Enters the remaining fuel and corresponding flight time.
[5R] ADD TEXT	When selected, the MCDU displays the TEXT page. ADD TEXT is active, while a message is being created.
[6R] ATC REP DISPL	When selected, the DCDU displays prepared message.

POSITION REPORT PAGE 3/3



```
  POSITION REPORT 3/3 ←→

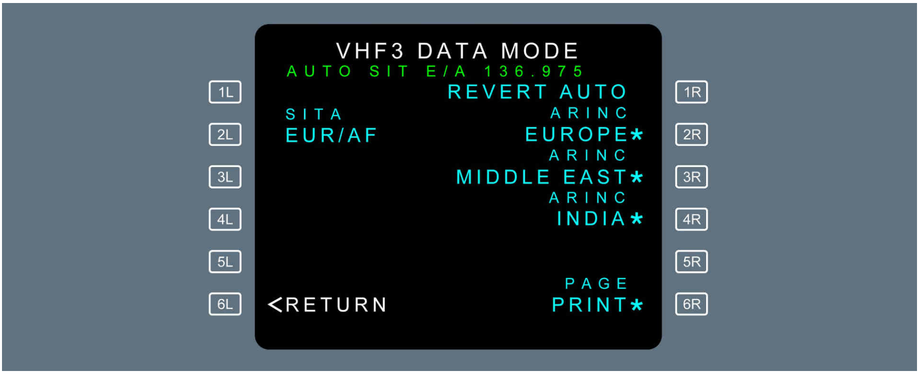
VHF3 DATA MODE

Ident.: DSC-46-10-40-30-00021077.0001001 / 22 MAR 17
Applicable to: ALL

EXAMPLE	This is an example of the VHF3 DATA MODE page. Information, that are displayed on the VHF3 DATA MODE page, depend on the service provider and datalink customization, selected by each operator. The VHF3 DATA MODE displays regions, and associated frequencies of datalink service providers that were selected.



VHF3 DATA MODE
AUTO SIT E/A 136.975
REVERT AUTO
SITA
EUR/AF
ARINC
EUROPE*
ARINC
MIDDLE EAST*
ARINC
INDIA*
PAGE
<RETURN
PRINT*

EXAMPLE		

	Line 1	Displays:
		- Mode of VHF provider selection:
		  - MANUAL
		    The VHF 3 is tuned to a frequency manually selected by the flight crew via the VHF3 DATA MODE page.
		  - AUTO
		    The VHF 3 is tuned to a frequency automatically selected by the ATSU.
		  - VOICE
		    The VHF 3 is in the voice mode.
		  - SCAN
		    The VHF 3 system scans for a data frequency.
		  - AUTO DATA INHIB
		    No datalink service provider is available in the area.
		- Datalink service provider identification
		- The frequency of the service provide that the system is tuned to

	[2L] SITA EUR/AF	Displays the service provider (SITA Europe/Africa). In this example, the ATSU is connected to the provider SITA Europe/Africa (136.975 MHz).
	[6L] RETURN	When selected, the MCDU displays the COMM MENU page.
	[1R] REVERT AUTO	Reverts to VHF 3 auto-tuning.
	[2R] ARINC EUROPE	When selected, the VHF 3 tunes to the frequency of the ARINC EUROPE provider. The mode of VHF provider selection changes to MANUAL.
	[3R] ARINC MIDDLE EAST	When selected, the VHF 3 tunes to the frequency of the ARINC MIDDLE EAST provider. The mode of VHF provider selection changes to MANUAL.
	[4R] ARINC INDIA	When selected, the VHF 3 tunes to the frequency of the ARINC INDIA provider. The mode of VHF provider selection changes to MANUAL.
	[6R] PAGE PRINT	When selected, the printer prints information from the VHF3 DATA MODE page.

VHF3 SCAN SELECT

Ident.: DSC-46-10-40-30-00021079.0001001 / 21 MAR 17
Applicable to: ALL

MCDU Scratchpad Messages

MCDU SCRATCHPAD MESSAGES

Ident.: DSC-46-10-40-40-10-00021151.0001001 / 21 MAR 17
Applicable to: ALL

MESSAGE	CONDITIONS
ALREADY SELECTED	The selectable key was selected.
BOTH ENTRY OUT OF RANGE or TWO ENTRY OUT OF RANGE	The double value that was entered is out of range.
ENTRY OUT OF RANGE	The single value that was entered is out of range.
FORMAT: _ _ _	The acquisition format is not valid. An example of the required format is displayed (FORMAT: NNN, FORMAT: XXXX, etc), where: - N : Numerical data (0 to 9) - X : Alphanumerical data (0 to 9, or A to Z). To display the required format of specific data on the scratchpad message field, press on the corresponding empty field. This serves as a reference to the flight crew.
LAST MSG ELEMENT	The maximum number of message elements, for a given downlink message, was reached.
NOT ALLOWED	Data entry is not allowed, or press on the selected key.
TOO MANY MSG ELEMENTS	It is not allowed to enter a new parameter, because the maximum number of message elements was reached.

Ident.: DSC-46-10-40-40-10-00021152.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

MESSAGE	CONDITIONS
A/C REGISTER NBR UNAVAIL	Notification is not available, because the Tail Number is unavailable.
A/C POS UNAVAILABLE	Notification is not available, because the Aircraft Position is unavailable.
ADS-C FUNCTION OFF or ADS FUNCTION OFF	The ADS-C DETAIL key/ADS DETAIL key was selected, but the page cannot currently be accessed, because the ADS-C is OFF, and consequently no ADS-C connections can be established.
CLR NOT ALLOWED	An available key has been selected, but the function is not available due to CLR still displayed on the scratchpad field.
COM UNAVAILABLE	The selected command is not available, because datalink communications means are currently unavailable.

Continued on the following page

Continued from the previous page

MESSAGE	CONDITIONS
DCDU FILE FULL	The selected command is not available, because the DCDU file is full.
ENTER MANDATORY FIELDS	Selection of a command is not available, because mandatory fields are not filled in.
FLIGHT NBR UNAVAILABLE	Notification is not available, because the flight number is unavailable.
KEY NOT ACTIVE	It is not allowed to press this key.
LAT/LON DISPL ABREVIATED	The LAT/LONG display is abbreviated only on the MCDU display field, because there is lack of space.
MSG ALREADY DISPLAYED	The ATC DISPL command is not available, because the message is already displayed on the DCDU.
MSG RECORD IS EMPTY	The MSG RECORD ERASE command is not available, because there are no messages recorded.
MSG RECORD NOT RELIABLE	Due to a technical problem, the list of messages recorded is not reliable. All CPDLC messages are deleted and new messages should not be recorded.
NO ACTIVE ATC	The ATC DISPL or the MAX UPLINK DELAY keys were selected, but the function is currently unavailable because there is no active CPDLC connection.
NO ADS-C CONNECTION or NO ADS CONNECTION	The ADS-C DETAIL key/ADS DETAIL key was selected, but the page cannot currently be accessed, because the ADS-C is ARMED but no connection is currently established.
NO DCDU MSG TO MODIFY	The MSG MODIFY key was selected, but the function is currently unavailable.
NO FM DATA	No FMS data are available when selecting the MODIFY key for a position report.
NO INPUTS	The ALL FIELDS ERASE command is not available, because there are no items to erase.
NO MSG TO PRINT	The PRINT key was selected, but the function is currently unavailable because there is no message to be printed.
NO WHOLE MSG PREPARED	Selection of the ATC DISPL or ADD TEXT command is not available, because the message is not completely prepared.
NON MODIFIABLE FIELD	A non-modifiable field was selected.
OUT OF RANGE	A single value of double data is out of range.
PRINT FAILED	Print fails after selection of the PRINT function.
PRINTER UNAVAILABLE	The PRINT key was selected, but the printer is currently unavailable.

Ident.: DSC-46-10-40-40-10-00021153.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

MESSAGE	CONDITIONS
ARPT/TYPE ALREADY USED	The same ART/TYPE have been introduced in at least two different fields of the ATIS MENU page.
CANCEL UPDATE BEFORE	The ARPT/TYPE left field cannot be modified because the automatic update function is still activated.
ENTER ARPT/TYPE FIELD	The SEND key has been selected, but the function is not available because the ARPT/TYPE field is empty.
GO TO ATIS MENU TO SEND	The AUTO UPDATE function has been armed on the ATIS AUTO UPDATE page. This scratchpad message is displayed to remind the crew that the request for automatic update of new ATIS reports has to be sent to the ground via the ATIS MENU page.
NEW ATIS: READ AGAIN	A new ATIS report has been received. This ATIS report replaces the ATIS report that was displayed. Therefore, the crew has to read the new ATIS report.
NEW MSG: READ AGAIN	An FSM (Flight System Message) has been received. The flight crew has to read this FSM.
NO ATIS REPORT RECEIVED	The ARPT/TYPE left key has been selected, but the function is not available because there are currently no ATIS reports.
NO PREVIOUS ATIS STORED	The PREV ATIS key is not available, because there is no previous ATIS report.
UPDATE IN PROGRESS	The ATIS AUTO UPDATE key associated to a specific ARPT/TYPE field has been selected, but the function is currently unavailable because updating is in progress.
WAITING: ATIS IN USE	The ARPT/TYPE left field cannot be modified because the ATIS report page is in use on the other MCDU.
WAITING: IN PROGRESS	The SEND key has been selected, but the function is not available because it is in progress.

MEMO DISPLAY

Applicable to: ALL

Ident.: DSC-46-10-40-60-A-00017111.0001001 / 21 MAR 16

COMPANY ALERT : This memo appears in green when the aircraft receives an uplink alert message, or when an AOC special condition requires a pilot action on the MCDU (depends on AOC programming). This memo pulses green for 180 s, then remains steady. It is associated with a buzzer for 1 s.

Ident.: DSC-46-10-40-60-A-00017213.0001001 / 21 MAR 16

COMPANY DATALINK STBY : This memo appears in green when the AOC datalink air-ground communication is temporarily unavailable, but not lost.

Ident.: DSC-46-10-40-60-A-00017212.0001001 / 21 MAR 16

DATALINK STBY : This memo appears in green when the datalink air-ground communication is temporarily lost.

Ident.: DSC-46-10-40-60-A-00017211.0001001 / 21 MAR 16

ATC DATALINK STBY : This memo appears in green when the ATC datalink air-ground communication is temporarily unavailable, but not lost.

Ident.: DSC-46-10-40-60-A-00017112.0001001 / 21 MAR 16

COMPANY CALL : This memo appears in green when the aircraft receives a message from the ground requesting voice communication on VHF.

Ident.: DSC-46-10-40-60-A-00017114.0001001 / 21 MAR 16

COMPANY MSG : This memo appears in green when the aircraft receives a message from the ground.

Intentionally left blank

INTRODUCTION

Ident.: DSC-46-10-50-00021046.0002001 / 21 MAR 17
Applicable to: ALL

How To chapter contains examples of:
- How to activate the datalink connection
- How to receive a datalink message
- How to create a datalink message
- How to send a datalink message.

Illustrations in How To are generic and do not reflect differences depending on the datalink standard installed in the aircraft.

HOW TO INITIALIZE

Ident.: DSC-46-10-50-00021047.0001001 / 31 AUG 17
Applicable to: ALL

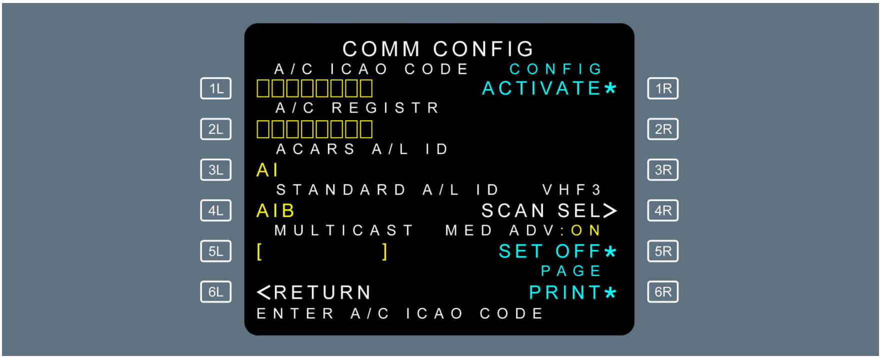
Datalink may be initialized:
- Automatically
  Datalink initializes automatically, provided that a list of service providers is scanned, and all required parameters are received, and validated by the ATSU.
- Manually
  Datalink may be initialized manually, when the system is not correctly initialized automatically.

The VHF3 SCAN SELECT page of the MCDU displays the list of service providers.
The COMM COMFIG page, on the MCDU displays required parameters.

MANUAL INITIALIZATION

If one of required parameters is not valid, one or more manual entries may be required:

● **If the A/C ICAO CODE is not valid:**
The MCDU scratchpad displays ENTER A/C ICAO CODE:



```
             COMM CONFIG
  A/C ICAO CODE         CONFIG
□□□□□□□□□            ACTIVATE*
  A/C REGISTR
□□□□□□□□□
  ACARS A/L ID
AI
  STANDARD A/L ID         VHF3
AIB                    SCAN SEL>
  MULTICAST        MED ADV:ON
[          ]           SET OFF*
                           PAGE
<RETURN                   PRINT*
ENTER A/C ICAO CODE
```

The flight crew clears the scratchpad, and inserts the A/C ICAO code (in hexal encoding) via the MCDU scratchpad.

A/C ICAO CODE..INSERT

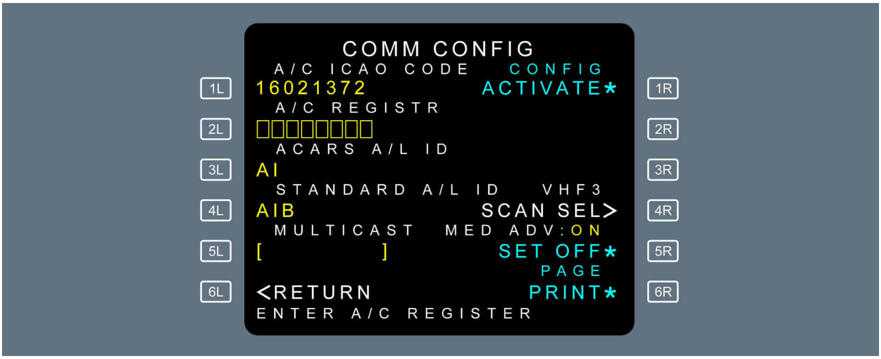
The flight crew inserts A/C ICAO code via the MCDU scratchpad into A/C ICAO CODE.

CONFIG ACTIVATE...SELECT

The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C ICAO code.

- **<u>If ARN is not valid</u>:**

  The MCDU scratchpad displays ENTER A/C REGISTER:



```
             COMM CONFIG
  A/C ICAO CODE         CONFIG
16021372             ACTIVATE*
  A/C REGISTR
□□□□□□□□□
  ACARS A/L ID
AI
  STANDARD A/L ID         VHF3
AIB                    SCAN SEL>
  MULTICAST        MED ADV:ON
[          ]           SET OFF*
                           PAGE
<RETURN                   PRINT*
ENTER A/C REGISTER
```

The flight crew clears the scratchpad, and inserts the A/C registration via the MCDU scratchpad.

A/C REGISTR..INSERT

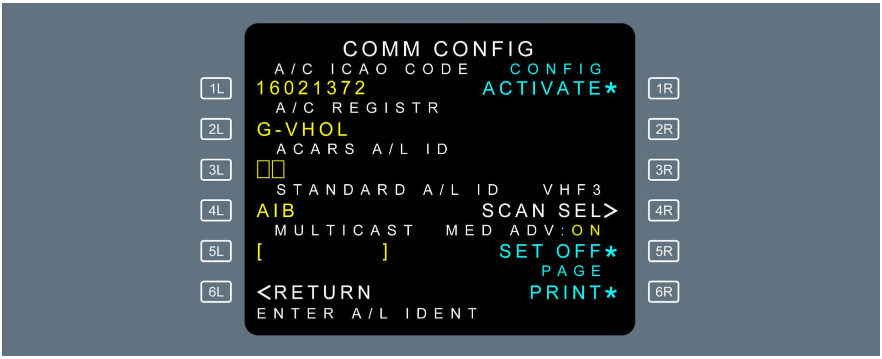
The flight crew inserts A/C ICAO registration via the MCDU scratchpad to A/C REGISTR.

CONFIG ACTIVATE...SELECT

The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C registration.

- **<u>If the A/L ID is not valid</u>:**

  The MCDU scratchpad displays ENTER A/L IDENT:



```
        COMM CONFIG
 A/C ICAO CODE        CONFIG
16021372           ACTIVATE*
 A/C REGISTR
G-VHOL
 ACARS A/L ID
□□
 STANDARD A/L ID       VHF3
AIB                SCAN SEL>
 MULTICAST      MED ADV:ON
[            ]      SET OFF*
                        PAGE
<RETURN               PRINT*
ENTER A/L IDENT
```

The flight crew clears the scratchpad, and inserts the two-letter A/L ID code via the MCDU scratchpad.

A/L ID...INSERT

The flight crew inserts A/L ID code via the MCDU scratchpad to A/L ID.

CONFIG ACTIVATE...SELECT

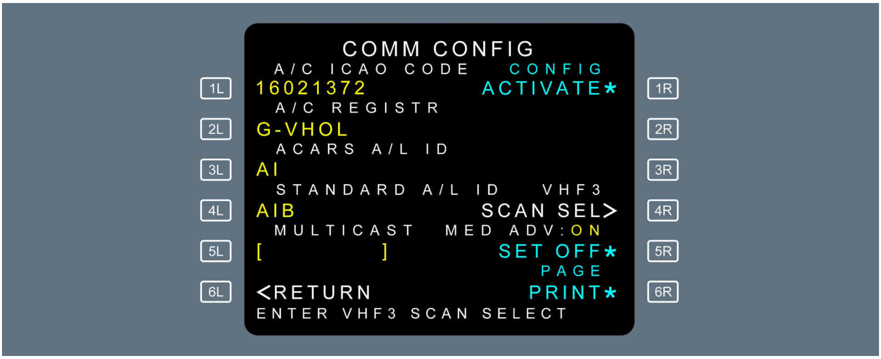
The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C registration.

- **<u>If VHF Service Provider is not selected</u>**

  and

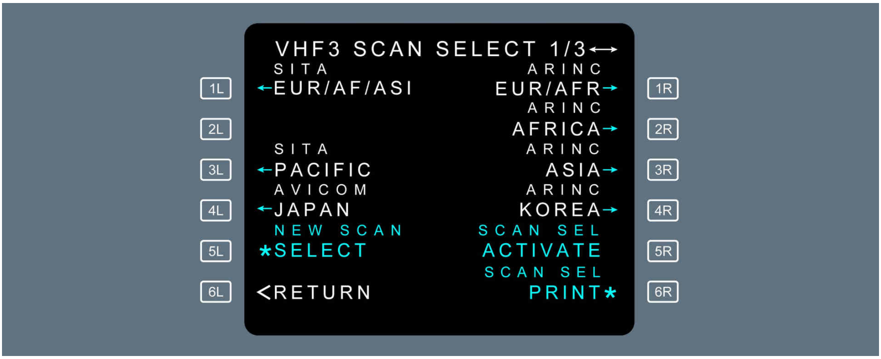
  <u>if the VHF3 SCAN/MASK SELECT menu can be accessed</u>:

  The MCDU scratchpad displays ENTER VHF3 SCAN SELECT:



```
       COMM CONFIG
 A/C ICAO CODE    CONFIG
16021372       ACTIVATE*
 A/C REGISTR
G-VHOL
 ACARS A/L ID
AI
 STANDARD A/L ID     VHF3
AIB              SCAN SEL>
 MULTICAST    MED ADV:ON
[       ]         SET OFF*
                      PAGE
<RETURN             PRINT*
ENTER VHF3 SCAN SELECT
```

On the VHF3 SCAN SELECT page, select service providers, in the airline priority order, and activate the VHF SCAN SELECT function.



```
  VHF3 SCAN SELECT 1/3←→
 SITA               ARINC
←EUR/AF/ASI      EUR/AFR→
                    ARINC
                  AFRICA→
 SITA               ARINC
←PACIFIC            ASIA→
 AVICOM             ARINC
←JAPAN             KOREA→
 NEW SCAN        SCAN SEL
*SELECT          ACTIVATE
                 SCAN SEL
<RETURN            PRINT*
```

EXAMPLE OF SELECTION OF DATALINK SERVICE PROVIDERS:

Selection of SITA 725 and ARINC service providers :

1. Press 5L key: The asterisk next to SELECT indication disappears, then reappears.
2. Press 1L key to select SITA 725: SELECT indication goes off, and the priority number of selection # 1 appears.
3. Press 1R key to select ARINC: SELECT indication goes off, and the priority number of selection # 2 appears.
4. Press 5R key to activate the VHF SCAN SELECT function: The asterisk next to SCAN SELECT ACTIVATE indication disappears, then reappears.

Note: *Modification of the SCAN SELECT setting may result in the loss of air-ground VHF datalink communication, and the increase of datalink service provider charges. Therefore, the SCAN SELECT setting should not be modified by the flight crew, unless the flight crew is instructed to do so.*

HOW TO NOTIFY

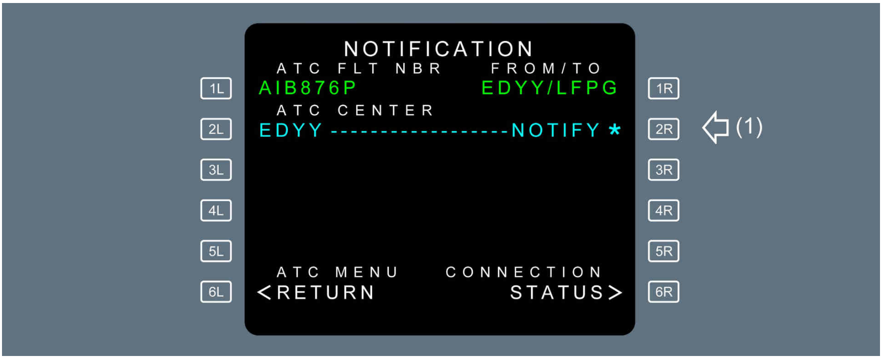
Ident.: DSC-46-10-50-00021048.0001001 / 21 MAR 17
Applicable to: ALL

- **On the MCDU:**

NOTIFICATION Page:

NOTIFY.. SELECT See (1)

The flight crew enters the ATC code via the MCDU scratchpad, if the FMS does not enter the ATC code automatically.



```
NOTIFICATION
 ATC FLT NBR         FROM/TO
AIB876P            EDYY/LFPG
 ATC CENTER
EDYY -----------------NOTIFY *

 ATC MENU          CONNECTION
<RETURN               STATUS>
```

If the ATC center accepts the notification:

When ATC center accepts the notification, the MCDU displays the name of the notified ATC center:

 ATC CENTER-NOTIF FAILED
EDYY -----------------NOTIFY *

  ATC MENU        CONNECTION
<RETURN               STATUS>
```

Note:
1. *For ADS-C ⊲ operations, check on the CONNECTION STATUS page of the MCDU, that the ADS-C ⊲ is set to ARMED (ON for FANS A ⊲) before sending a notification.*
2. *The notified ATC center initiates the CPDLC and/or ADS-C ⊲ connection. Therefore, re-notifications should be avoided.*
3. *An automatic transfer from one ATC center to the next ATC center can be expected, if:*
   - *The MCDU displays the next ATC code, on the CONNECTION STATUS Page*
   - *The DCDU displays NEXT ATC information with the desired ATC code, on the default screen, when no datalink message is displayed.*

HOW TO CONNECT

Ident.: DSC-46-10-50-10-00021049.0001001 / 21 MAR 17
Applicable to: ALL

CPDLC CONNECTION

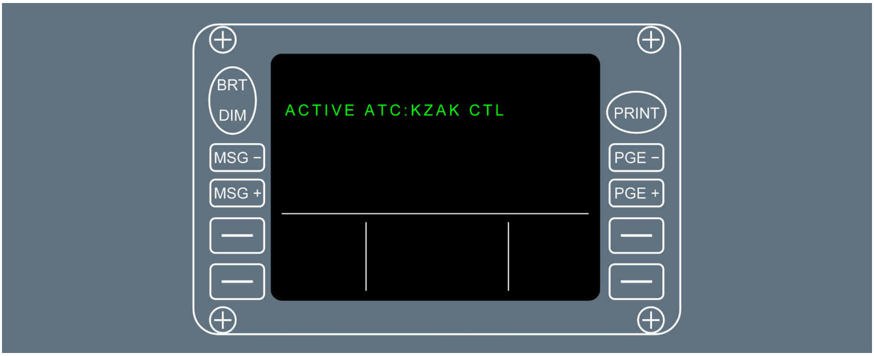
CONNECTION TO ACTIVE ATC

The ATC center initializes the CPDLC connection, when the ATC center receives a notification from the aircraft.
The DCDU displays the connected ATC (ACTIVE ATC), when the connection is established.
The MCDU displays the connected ATC (ACTIVE ATC) on the CONNECTION STATUS page.

ACTIVE ATC..VERIFY

The flight crew must verify that the desired ATC center is connected.

ACTIVE ATC on the DCDU



ACTIVE ATC:KZAK CTL

CONNECTION TO NEXT ATC

The active ATC can transfer the datalink connection to a next ATC without requiring a flight crew action.
If the active ATC transfers the connection to the next ATC, the DCDU will automatically display the next ATC code in the NEXT ATC field, on the default screen, under the next ATC code in the NEXT ATC field.

When the flight crew receives a message of service termination from the active ATC, the next ATC becomes the active ATC.

Ident.: DSC-46-10-50-10-00021050.0001001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

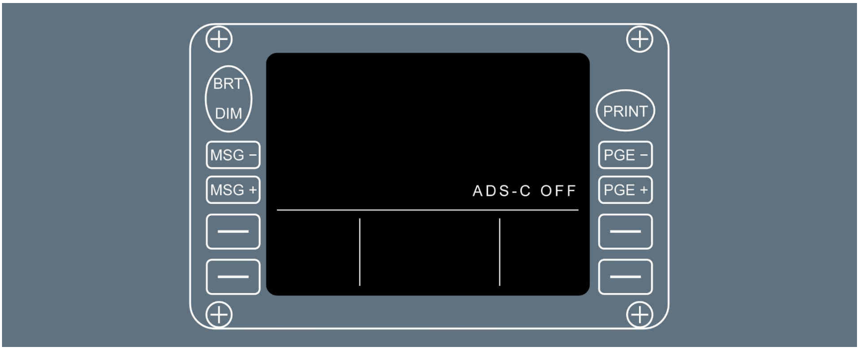
ADS-C CONNECTION

■ If the ADS-C is OFF:

The ADS-C is not connected.

The CONNECTION STATUS page of the MCDU displays ADS-C OFF.
The DCDU displays ADS-C OFF:

ADS-C OFF on the DCDU



■ If the ADS-C is ON:

- **On the MCDU:**
  ADS-C DETAIL Page
  or
  ADS DETAIL Page:

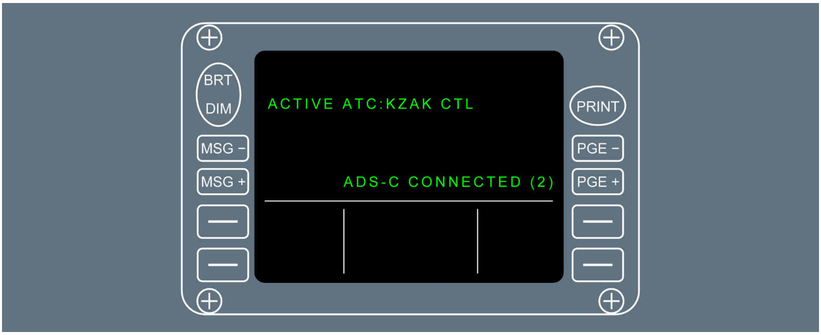
  CONNECTED ATC.. VERIFY
  The flight crew must verify that the desired ATC center is connected.

The ADS-C DETAIL / ADS DETAIL page displays connected ATC centers. for information displayed on the ADS-C DETAIL / ADS DETAIL page.Refer to DSC-46-10-40-30 ADS-C DETAIL.

- **On the DCDU:**

  The DCDU displays ADS-C ON and the number of connected ATC centers:

ADS-C CONNECTED and ACTIVE ATC on the DCDU



```
ACTIVE ATC:KZAK CTL

              ADS-C CONNECTED (2)
```

HOW TO SEND REQUEST TO ATC

HOW TO SEND A POSITION REPORT

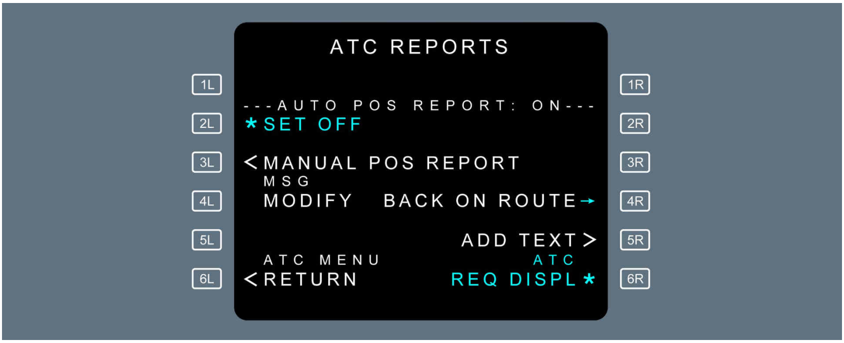
Ident.: DSC-46-10-50-00021056.0001001 / 21 MAR 17
Applicable to: ALL

- ### If the AUTO POS REPORT function is set to ON:

  - **On the MCDU:**

    ATC REPORTS Page:
    The MCDU displays AUTO POS REPORT: ON:

AUTO POS REPORT ON on the ATC REPORTS Page



```
           ATC REPORTS

---AUTO POS REPORT: ON---
*SET OFF

<MANUAL POS REPORT
 MSG
 MODIFY   BACK ON ROUTE→

              ADD TEXT>
 ATC MENU            ATC
<RETURN        REQ DISPL*
```

The FMGES generates automatically the position report message on the DCDU, when a waypoint is sequenced.

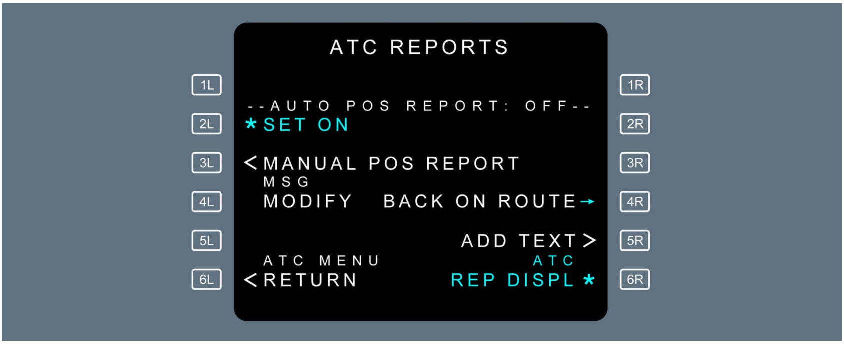
Note: *It is recommended to update the flight plan during the flight. The FMGES offset function should be used, when it is appropriate. When the heading mode is used, the flight crew should monitor and sequence waypoints of the flight plan as required.*

- ### If the AUTO POS REPORT function is set to OFF:

  - **On the MCDU:**

    ATC REPORTS Page:
    The MCDU displays AUTO POS REPORT: OFF:

AUTO POS REPORT OFF on the ATC REPORTS Page



ATC REPORTS

--AUTO POS REPORT: OFF--
*SET ON

<MANUAL POS REPORT

■ If the flight crew decides to modify the clearance:

- The flight crew loads the clearance into the SEC F-PLN, on the MCDU and modifies it.
- The flight crew rejects the clearance by selecting UNABLE on the DCDU.
- The flight crew sends a new request (with the modified F-PLN) to the ATC.

ATC MSG RECORD NOT RELIABLE - DISPLAYED AT ATSU POWER-UP

Ident.: DSC-46-10-100-00024089.0001001 / 28 MAY 20
Applicable to: ALL

DESCRIPTION

In some specific cases, such as ATSU power-up, the flight crew may experience the following:

- ATC MSG RECORD NOT RELIABLE DCDU message
- MSG RECORD NOT RELIABLE MCDU scratchpad message when the flight crew selects the MSG RECORD menu on the MCDU.

The flight crew may experience this abnormal behavior if, before the previous ATSU power-off, two CPDLC messages with the same time stamp were stored in the MSG RECORD.
At the next ATSU power-up, the MSG RECORD is emptied and the subsequent CPDLC messages are not stored in the MSG RECORD.

OPERATIONAL RECOMMENDATION

In such situation, the flight crew should perform a manual reset of the ATSU in order to recover the nominal ATSU behavior.*Refer to PRO-ABN-ABN-RST System Reset Table - DATALINK*.

Intentionally left blank

INTRODUCTION

Ident.: DSC-46-20-00015782.0001001 / 05 JAN 15
Applicable to: LV-FVH, LV-FVI, LV-KAN, LV-KAO

The Aircraft Information Network System (AINS) is part of FlySmart with Airbus. FlySmart with Airbus is made up of the following systems:
- The AINS
- Two Onboard Information Terminal ◁ (OIT).

FlySmart with Airbus is an Airbus solution for EFB operations.

The AINS consists of an integrated avionics file server providing a host-platform for maintenance and operations applications, a secured interface to the avionics and a communication link between the aircraft Ethernet Local Area Network (ELAN) and the airline ground-based information system. This system acquires, stores, processes, and transmits data from the avionics to the:
- Flight crew, to accomplish performance calculations, consult documentation...
- Airline network via the Gatelink
- Maintenance operator, for fast and efficient troubleshooting.

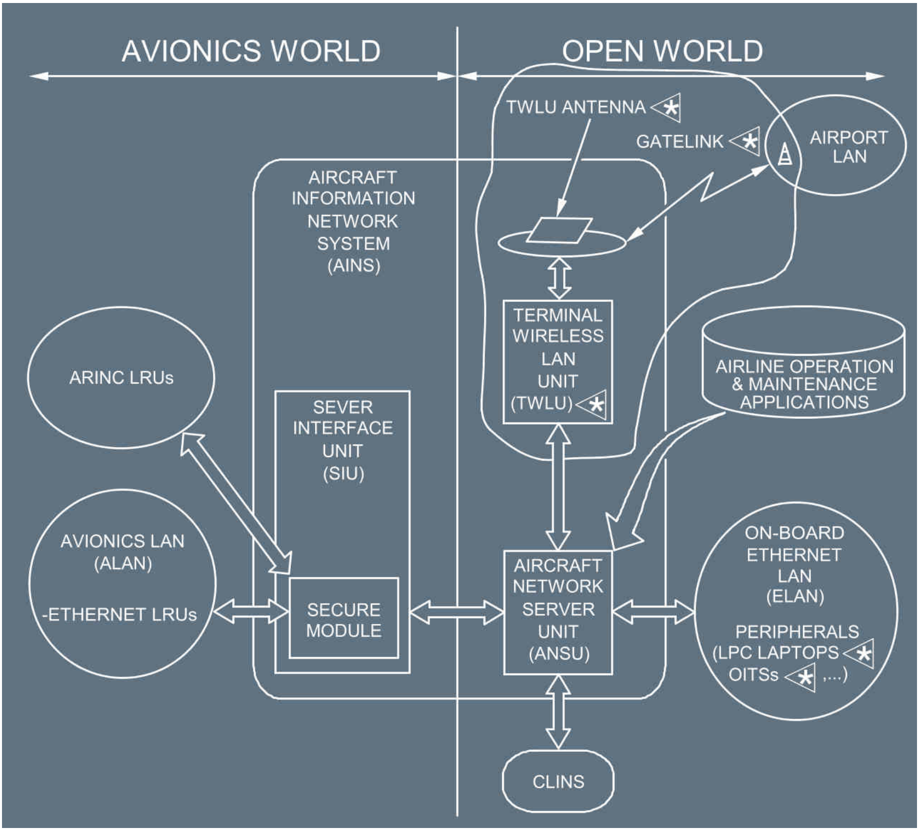
AINS maintenance and operations applications are installed by the airline, under its own responsibility. Due to the highly customized programming, AINS functions may vary for different airlines and are, therefore, not described in detail.

SYSTEM DESCRIPTION

Ident.: DSC-46-20-00015783.0001001 / 05 JAN 15
Applicable to: LV-FVH, LV-FVI, LV-KAN, LV-KAO

The AINS is capable of receiving or sending information from/to the aircraft's Line Replaceable Units (LRU).

The different parts of this system are considered to belong to one of the two following worlds:
- An “open world”, since its elements are open to the outside, and use commercial off-the-shelf software products with high updating possibilities, etc.
- The “avionics world”, which is protected by a secure module.



AVIONICS WORLD
OPEN WORLD
TWLU ANTENNA ◁
GATELINK ◁

-ETHERNET LRUs
SECURE MODULE
AIRCRAFT NETWORK SERVER UNIT (ANSU)
ON-BOARD ETHERNET LAN (ELAN)
PERIPHERALS (LPC LAPTOPS ◁ OITSs ◁ ,...)
CLINS

The AINS consists of:

- An Aircraft Network Server Unit (ANSU): To provide powerful server and data management functions onboard the aircraft.
- A Server Interface Unit (SIU):To protect avionics from pollution from the open world, providing isolation between avionics and open networks.
- A Terminal Wireless LAN Unit ◁ (TWLU) and TWLU antenna ◁ : To provide wireless connection between the AINS and Airport Local Area Network (LAN).

Note: Through the GATELINK pb-sw ◁ , on the overhead panel, TWLU ◁ and TWLU antenna ◁ provide on-ground wireless connection between the AINS and Airport LAN.

COCKPIT ARRANGEMENT

Ident.: DSC-46-20-00015784.0001001 / 05 JAN 15
Applicable to: LV-FVH, LV-FVI, LV-KAN, LV-KAO

In the cockpit, the AINS can interface with laptops and printers via the:
- Captain's AINS plug
- First Officer's AINS plug
- Third Occupant's AINS plug ◁✱

INTRODUCTION

Ident.: DSC-46-40-00021021.0001001 / 04 JUN 19
Applicable to: ALL

The FlySmart with Airbus application suite is composed of:
- Takeoff application
- Landing application
- In-flight application
- Loadsheet application
- Operational Documentation application (OLB)
- Electronic QRH application (eQRH)
- Manager application (available for iPad version)

The FlySmart with Airbus application suite is designed to:
- Improve access to flight crew's operational information
- Reduce the quantity of paper documents in the cockpit by replacing them with electronic documents
- Enable reduced revision and distribution cycles to ensure better technical data accuracy
- Ease and improve the operational data updating process
- Provide an accurate and optimized computation of performance.

The FlySmart with Airbus application suite can be used by the flight crew on a Portable Equipment Device (PED).
The flight crew can use the power outlet ◁ (110 VAC / 60 Hz) installed on the lateral console to plug their PED.

Note: *The power outlets (115 VAC / 400 Hz) located on the rear of the cockpit are for maintenance use only.*

GENERAL

Ident.: DSC-46-40-00021022.0001001 / 22 MAR 17
Applicable to: ALL

The My Flight page enables:
- To check that FlySmart with Airbus applications are up to date. The My Flight page provides the version of the installed applications and data (EFB version)
- To start the Manager application, that enables to update the operational data (performance, manuals)
- To initialize the applications with the applicable aircraft tail number, flight number and citypair. This avoids multiple entries of the same data in the different applications.

There is one My Flight page per application. All the inputs that the user has entered on one My Flight page are retrieved by the other applications.

Note: *On the My Flight page of OLB application, the user can only enter the a/c type and a/c registration.*

LANDING APPLICATION

Ident.: DSC-46-40-00021023.0001001 / 22 MAR 17
Applicable to: ALL

The Landing application aims at computing the landing performance data (maximum landing weight, approach speed) according to the aircraft configuration and external conditions (runway, surrounding obstacles, weather).
The Landing application allows straightforward computations and provides the optimized landing performance for the given conditions.

TAKEOFF APPLICATION

Ident.: DSC-46-40-00021025.0001001 / 22 MAR 17
Applicable to: ALL

The Takeoff application aims at computing the takeoff performance data (maximum takeoff weight, takeoff speeds, flexible temperature) according to the aircraft configuration and external conditions (runway, surrounding obstacles, weather).
The Takeoff application allows straightforward computations and provides the optimized takeoff performance for the given conditions.

IN-FLIGHT APPLICATION

Ident.: DSC-46-40-00023627.0001001 / 04 JUN 19
Applicable to: ALL

The In-flight application aims at computing the in-flight performance data (time, fuel consumption, distance, altitude) according to the aircraft configuration and external conditions (weather).
The In-flight application allows straightforward computations and provides the optimized in-flight performance for the given conditions.

LOADSHEET APPLICATION

Ident.: DSC-46-40-00021026.0001001 / 22 MAR 17
Applicable to: ALL

The Loadsheet application allows the flight crew users to prepare the aircraft loading and to check that all weights and CG remain within the loading operational envelope. This eases the computation of the ZFWCG, ZFW, TOW and TOCG, and enables last–minute changes to the passenger/cargo/fuel distribution.

Depending on airline’s authority requirements, the Loadsheet application can also generate a load and trim sheet.

OPS LIBRARY APPLICATION

Ident.: DSC-46-40-00021027.0001001 / 22 MAR 17
Applicable to: ALL

The OLB application enables the onboard consultation of any flight operations document published in the relevant format (e.g. airline's manuals), including the ones delivered by Airbus (FCOM, MEL, AFM, CDL, FCTM).
MEL and CDL items (including missing items) selected on OLB application are automatically transferred to Takeoff and Landing applications.

ELECTRONIC QRH APPLICATION

Ident.: DSC-46-40-00021145.0001001 / 04 JUN 19
Applicable to: ALL

The electronic QRH application (eQRH) is an application that enables the flight crew to:
- Manage the Normal Checklists and some Abnormal Procedures
- Access to some important operational data that may be required during the flight (such as the OEBs).

MANAGER APPLICATION

Ident.: DSC-46-40-00021028.0001001 / 22 MAR 17
Applicable to: ALL

The Manager application aims at updating on the iPad the operational data used by FlySmart with Airbus applications for iPad: performance data and operational manuals.

GENERAL

Ident.: DSC-49-10-10-00000941.0001001 / 21 MAR 17
Applicable to: ALL

The Auxiliary Power Unit (APU) is a self contained unit which makes the aircraft independent of external pneumatic and electrical power supply.

On ground

- It supplies bleed air for starting the engine and for the air conditioning system.
- It supplies electrical power to the electrical system.

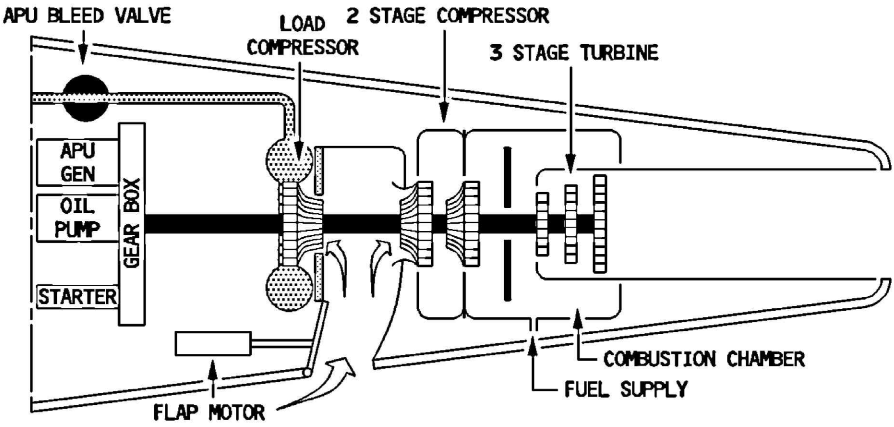
During Take-Off

- It supplies bleed air for air conditioning, thus avoiding a reduction in engine thrust caused by the use of engine bleed air for this purpose, when optimum aircraft performance is required.

In Flight

- It backs up the Electrical system
- It backs up the Air conditioning
- It can be used to start the engines

The APU may obtain power for starting from the batteries specifically assigned to the APU, or in combination with the external power, or normal aircraft supply.
APU start is permitted throughout the normal flight envelope, except when APU battery only is supplying (*Refer to LIM-APU Operational Envelope*).
The ECAM displays APU parameters.



APU BLEED VALVE

FUEL SUPPLY
FLAP MOTOR

Intentionally left blank

APU ENGINE

Ident.: DSC-49-10-20-00000943.0001001 / 16 MAR 11
Applicable to: ALL

The basic element of the APU is a single shaft gas turbine which delivers mechanical shaft power for driving the accessory gearbox (electrical generator) and produces bleed air (engine starting and pneumatic supply).

ELECTRONIC CONTROL BOX

Ident.: DSC-49-10-20-00000944.0002001 / 16 MAR 11
Applicable to: ALL

The Electronic Control Box (ECB) is primarily a full authority digital electronic controller that performs the APU system logic for all modes of APU operation such as :
- Sequence the start and monitors it
- Monitors speed and temperature
- Monitors bleed air (IGV)
- Sequence the shut down (manual, protective or inhibited)

AIR INTAKE SYSTEM

Ident.: DSC-49-10-20-00000945.0001001 / 16 MAR 11
Applicable to: ALL

The air intake and an electrically operated flap allow the external air to reach the compressor inlet.

STARTER

Ident.: DSC-49-10-20-00000946.0001001 / 16 MAR 11
Applicable to: ALL

The ECB controls the electric starter. The starter engages if the air intake is fully open and provided the MASTER SW and the START pushbutton are ON.

FUEL SYSTEM

Ident.: DSC-49-10-20-00000947.0001001 / 04 JUN 19
Applicable to: ALL

The APU is supplied with fuel through the trim tank transfer line.
The ECB controls the fuel flow.

Note: *The APU fuel feed line is pressurized when the APU MASTER pb-sw is set to ON. If the initial start attempt fails, the crew may wait 3 min before setting the APU START pb-sw to ON again. This delay ensures the APU fuel feed line is sufficiently pressurized.*

OIL SYSTEM

Ident.: DSC-49-10-20-00000948.0001001 / 16 MAR 11
Applicable to: ALL

The APU has an integral independent lubrication system (for lubrication and cooling).

INLET GUIDE VANES (IGV)

Ident.: DSC-49-10-20-00000949.0001001 / 16 MAR 11
Applicable to: ALL

The IGVs control bleed air flow, and a fuel-pressure-powered actuator positions the IGVs.
The ECB controls the actuator in response to aircraft demand.

AIR BLEED SYSTEM

Ident.: DSC-49-10-20-00000950.0002001 / 10 JAN 11
Applicable to: ALL

The ECB controls the APU BLEED valves. If APU BLEED is set to ON, the bleed valve closes at 25 000 ft when climbing, and reopens at 23 000 ft when descending.

CONTROLS

Ident.: DSC-49-10-20-00000952.0001001 / 16 MAR 11
Applicable to: ALL

The flight crew uses the controls on the APU panel for routine shutdown. For emergency shutdown :
- The flight crew can push the APU FIRE handle, or
- The ground crew can push the APU SHUT OFF pushbutton on the interphone panel under the nose fuselage, or the APU EMER SHUT DOWN pushbutton on the refueling/defueling panel.

GROUND OPERATIONS SAFETY DEVICES

Ident.: DSC-49-10-20-00000953.0001001 / 16 MAR 11
Applicable to: ALL

APU FIRE WITH AUTOMATIC SHUTDOWN

The APU may run, without cockpit crew supervision, when the aircraft is on ground. In case of fire in the APU compartment :
- APU fire warnings operate in the cockpit
- A horn in the nose gear bay sounds
- The “AVAIL” light goes off
- The “FAULT“ light in the MASTER SW comes on

- The APU shuts down
- The APU fire extinguisher discharges.

Note: *On ground, the No Break Power Transfer (NBPT) function is inhibited, in the following cases of APU shutdown :*
- *The APU is shut down, by using the APU SHUT OFF switch on the external power panel (925 VU).*
- *An APU emergency shutdown is triggered, by using the APU EMER SHUT DOWN switch on the REFUEL/DEFUEL panel (990 VU).*
- *An automatic APU shutdown is triggered by the ECB.*
- *The APU is shut down, by using the APU FIRE pushbutton.*

OPERATION UNDER FAILURE CONDITIONS

Ident.: DSC-49-10-20-00000954.0001001 / 16 MAR 11
Applicable to: ALL

APU FAULT WITH AUTOMATIC SHUTDOWN

The following failures cause an automatic shutdown :
1. Overspeed
2. Certain critical ECB internal failures
3. Underspeed
4. Start abort
5. Low oil pressure
6. High oil temperature
7. Load compressor overtemperature
8. Generator high oil temperature
9. DC power interrupt (BAT OFF, when aircraft on batteries only)
10. Overtemperature
11. Certain ECB internal failures

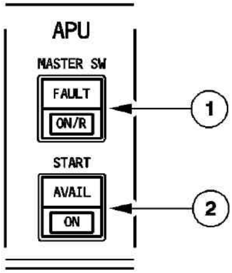
Failure causes 1 and 2 lead to an automatic shutdown (protective shutdown) in all flight phases. For failures 3 through 11, the automatic shutdown is inhibited to ensure APU availability (inhibited shutdown in flight phase 2 to 9).

Intentionally left blank

OVERHEAD PANEL

Applicable to: ALL

Ident.: DSC-49-20-A-00017859.0001001 / 21 MAR 16



Ident.: DSC-49-20-A-00017861.0004001 / 21 MAR 16

(1) APU MASTER SW pb-sw

This pushbutton controls the electric supply for APU operation, and its protective features. It also controls the start and shutdown sequences

FAULT lt : This amber FAULT light comes on, and a caution appears on the ECAM, when an automatic APU shutdown occurs (*Refer to DSC-49-10-20 Ground Operations Safety Devices*).

Note: *In case of automatic, non emergency shutdown, the air inlet flap closes 15 min after the APU speed is lower than 7 %.*
If an automatic, non-emergency shutdown happens on ground, the 15 min countdown starts after liftoff.

ON/R :
- The blue ON light comes on.
- Electric power goes to the APU system, and the ECB performs a power-up test.
- The APU air-intake flap opens.
- The APU fuel isolation valve and APU LP valve open.
- The FWD APU and aft APU fuel pumps operate during the trim tank fuel transfer, and depending on the pressure in the trim tank line.
- If the aircraft has ground power or main generator power, the APU page appears on the ECAM display.

Off : Manual shutdown sequence.

- The ON light of the MASTER SW pb-sw goes off.
- After a running period of 15 s (for No Break Power Transfer), the APU shuts down and the AVAIL light goes off,
- If the APU BLEED was selected, the APU performs a cooling period of 85 s at 82 % speed,
- At N 7 % the air-inlet flap closes.

Note: Switching the MASTER SW off then on, resets the ECB.

Ident.: DSC-49-20-A-00017862.0001001 / 21 MAR 16

(2) APU START pb-sw

ON : The blue light comes on.
When the flap is completely open, the APU starter is energized.
When N = 7 %, ignition is turned on.
When N = 50 %, the APU starter is de-energized, and ignition is turned off.
When N = 95 %, the ON light on the START pushbutton goes off and AVAIL comes on in green.
The APU may now supply bleed air and electrical power to the aircraft systems.
10 s later, the APU page disappears from the ECAM display.

AVAIL lt : This light comes on green, when N reaches 95 %.

Ident.: DSC-49-20-B-00017869.0001001 / 21 MAR 16

(2) APU Bleed Valve Position

It is only displayed, if the APU MASTER sw is ON/R.

In line – Green	:	The APU valve is fully open.
Crossline – Green	:	The APU valve is not fully open, and APU BLEED pb is OFF.
Crossline – Amber	:	The APU valve is not fully open, if APU BLEED pb is ON.

Ident.: DSC-49-20-B-00017870.0001001 / 21 MAR 16

(3) APU Bleed Air Pressure

This box displays the relative bleed air pressure in green.

It shows an amber XX, when ADIRS 1 is not available or selected OFF.

Ident.: DSC-49-20-B-00017871.0001001 / 21 MAR 16

(4) APU GEN Line ContactorIndication

It is in green, when the APU GEN line contactor is closed.
It is in white, if the line contactor is open.

Ident.: DSC-49-20-B-00017872.0001001 / 21 MAR 16

(5) APU GEN

It is identical to the APU GEN parameters on the ELEC page.

Ident.: DSC-49-20-B-00017873.0001001 / 21 MAR 16

(6) FUEL LO PR

It is in amber, if APU fuel low pressure is detected.

Ident.: DSC-49-20-B-00017874.0001001 / 21 MAR 16

(7) FLAP OPEN

Displayed in green, when the APU air intake flap is fully open (MASTER SW pb-sw is ON).

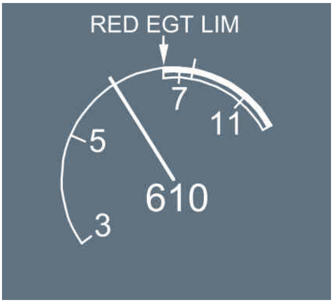
Ident.: DSC-49-20-B-00017875.0001001 / 21 MAR 16

(8) APU N

- Displays the APU speed in green
- It becomes red, when N ≥ 107 %.

Ident.: DSC-49-20-B-00017876.0001001 / 21 MAR 16

(9) APU EGT



- It displays the APU EGT (needle and digital indication) in green
- It pulses, when the ECB detects an advisory
- It becomes red, when EGT ≥ RED EGT LIM. In this case an automatic shutdown of the APU occurs.

  Note: *ECB calculates the RED EGT LIM and transmits it to the ECAM. It is equal to the lower border of the red sector. It is a function of N during start, and a function of ambient temperature and pressure when the APU is running.*
  Maximum EGT during start : 1 250 °C (corresponding to 0 % APU speed).
  Maximum EGT with APU running : 650 °C (Sea level, standard day).

Ident.: DSC-49-20-B-00017877.0001001 / 21 MAR 16

(10) LOW OIL LEVEL

This advisory is displayed, if the ECB detects a low APU oil level, when the aircraft is on ground and the APU is not running.

MEMO DISPLAY

Ident.: DSC-49-20-00017093.0001001 / 21 MAR 16
Applicable to: ALL

APU AVAIL : This memo appears in green when APU N is above 95%.

GENERAL

Ident.: DSC-52-10-10-00017252.0001001 / 21 MAR 16
Applicable to: ALL

The A330 fuselage has :

- Six passenger doors
- Two emergency exits in the cabin
- Two cockpit emergency exits (sliding windows)
- Three cargo compartment doors
- One avionic compartment access door.

All doors are monitored by the Doors and Slides Control System (DSCS). The DSCS generates indications and warnings on the doors and on the ECAM.

Applicable to: ALL

The aircraft has six plug-type doors that open outward and forward. There are three doors on each side of the fuselage (one door in FWD, MID and AFT sections).
The doors are operated from inside or outside. Normal operation is manual with hydraulic damping and a gust lock mechanism.
Each door has emergency features:

- A slide stowed in a container, attached to the inboard lower side of the door
- A damper actuator. In normal mode, the damper actuator limits the door travel. In emergency mode, the damper actuator drives the automatic door opening
- A slide arming lever.

Note: *The aircraft can be equipped with either escape slide or slide raft.*

When the slide arming lever is in the ARMED position, the slide is connected to the floor brackets on both sides of the door. When the door is open from inside, the slide automatically inflates and deploys. If the inflation bottle fails to automatically discharge, a crew member can open its valve to make it discharge. Opening the door from outside disarms the door and the slide.
Each passenger door has:

- Two mechanical locking indicators that confirm the locked or unlocked position of the door
- One warning light to show the ARMED or DISARMED indication of the slides
- One CABIN PRESSURE warning light that illuminates in the case of a residual pressure in the cabin.

Intentionally left blank

COCKPIT

Ident.: DSC-52-10-30-00017382.0002001 / 21 MAR 16
Applicable to: ALL

The two sliding windows in the cockpit are flight crew emergency exits.
A small compartment, located above each window, contains an escape rope that reaches the ground, when lowered through the cockpit window.
The cockpit windows can only be opened from inside.
Emergency cockpit evacuation is also possible through the cockpit door escape panel.

CABIN

Ident.: DSC-52-10-30-00017381.0001001 / 21 MAR 16
Applicable to: ALL

One plug-type emergency exit door is located on each side of the cabin.
They open outward and forward, and are each equipped with an escape slide. The escape slide is stowed in a container which is attached to the lower part of the emergency exit door.

Intentionally left blank

GENERAL

Ident.: DSC-52-10-40-00017386.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has two cargo compartment doors and a bulk cargo compartment door ⊲✳ on the right side of the fuselage, below the cabin floor.

FWD AND AFT CARGO DOORS

Ident.: DSC-52-10-40-00017385.0001001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

The FWD and AFT cargo doors open outward and upward. The doors are hydraulically operated by the yellow hydraulic system. The door locking system is mechanical. When a door is open, the door actuator is mechanically locked in its extended position.
If the electric pump of the yellow hydraulic system fails, the system can be powered by using a hand pump, located on the hydraulic maintenance panel.
The FWD and AFT cargo doors open only from the outside.
A red light fitted in the compartment of the locking handle indicates a residual cabin pressure.
The door open indicator light confirms that the door is locked in the open position for a safe cargo loading operation.
Ten flag indicators inform the operator that the door is fully locked. A pop-up flag indicator warns of an open loop (the door is not fully locked).

Note: *When the electric pump operates the FWD or AFT cargo door, the remaining yellow system device that operates is the engine 2 thrust reverser. The leak measurement valves of yellow system close, and an SFCC inhibition prevents any flap movement.*

FWD AND AFT CARGO DOORS

Ident.: DSC-52-10-40-00017385.0003001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The FWD and AFT cargo doors open outward and upward. The doors are hydraulically operated by the yellow hydraulic system. The door locking system is mechanical. When a door is open, the door actuator is mechanically locked in its extended position.
If the electric pump of the yellow hydraulic system fails, the system can be powered by using a hand pump, located on the hydraulic maintenance panel.
The FWD and AFT cargo doors open only from the outside.
A red light fitted in the locking handle’s compartment indicates a residual cabin pressure.
The door open indicates light confirms that the door is locked in the open position for a safe cargo loading operation.
Ten flag indicators inform the operator that the door is fully locked. A pop-up flag indicator warns of an open loop (the door is not fully locked).

Note: *When the electric pump operates the FWD or AFT cargo door, no other yellow system device remains operative. The leak measurement valves of yellow system close, and an SFCC inhibition prevents any flap movement.*

BULK CARGO DOOR

Ident.: DSC-52-10-40-00017384.0001001 / 21 MAR 16
Applicable to: ALL

The bulk cargo door is a plug-type door that is mechanically locked and manually operated. The bulk cargo door opens inward and upward.
The bulk cargo door can be opened either from inside or from the outside.

GENERAL

Ident.: DSC-52-10-80-00018096.0001001 / 21 MAR 16
Applicable to: ALL

The Doors and Slides Control System (DSCS) consists of:
- Proximity switches, installed on each door
- The Proximity Switch Control Unit (PSCU)
- A pressure switch (ΔP of the cabin)
- An autonomous standby power supply.

The Doors and Slide Control system performs the following functions:
- Door warning system: Indicates the state (LOCKED/UNLOCKED) of each door on the ECAM
- Escape slide warning system: Indicates the state (ARMED/DISARMED) of the slide, on the ECAM and on the slide warning light. In addition to the white light, a warning horn ◁✳ sounds to avoid an inadvertent escape slide extension, during normal door opening
- Overpressure warning system: Indicates an excessive residual differential cabin pressure to the passenger doors, the emergency exits, and the FWD and AFT cargo doors
- Electrical control of the FWD and AFT cargo doors.

When a door (CAB, CARGO, BULK) is not fully closed and locked, or a sensor is faulty, the DSCS prevents aircraft pressurization with one engine running. In such a case, the DSCS signals the cabin pressure system to keep the outflow valves open, and signals the zone controller to close the pack flow control valves.
If one proximity switch fails, the faulty switch can be overridden by using the DOOR SW OVRD pb ◁✳ , as per the MMEL procedure.

COCKPIT DOOR DESCRIPTION

Ident.: DSC-52-30-10-00017227.0009001 / 20 MAR 17
Applicable to: LV-GKO, LV-GKP, LV-KAN, LV-KAO

A forward-opening hinge door separates the cockpit from the passenger compartment. It has an electric-locking latch, controlled by the flight crew. In normal conditions, when the door is closed, it remains locked. When there is a request to enter the cockpit, the flight crew can authorize entry by unlocking the door, that remains closed until it is pushed open.

When the flight crew does not respond to requests for entry, the door can also be unlocked by the cabin crew, by entering a two to seven-digit code (programmed by the airline) on the keypad, installed on the door post. The door is bulletproof and fully compliant with rapid decompression requirements.

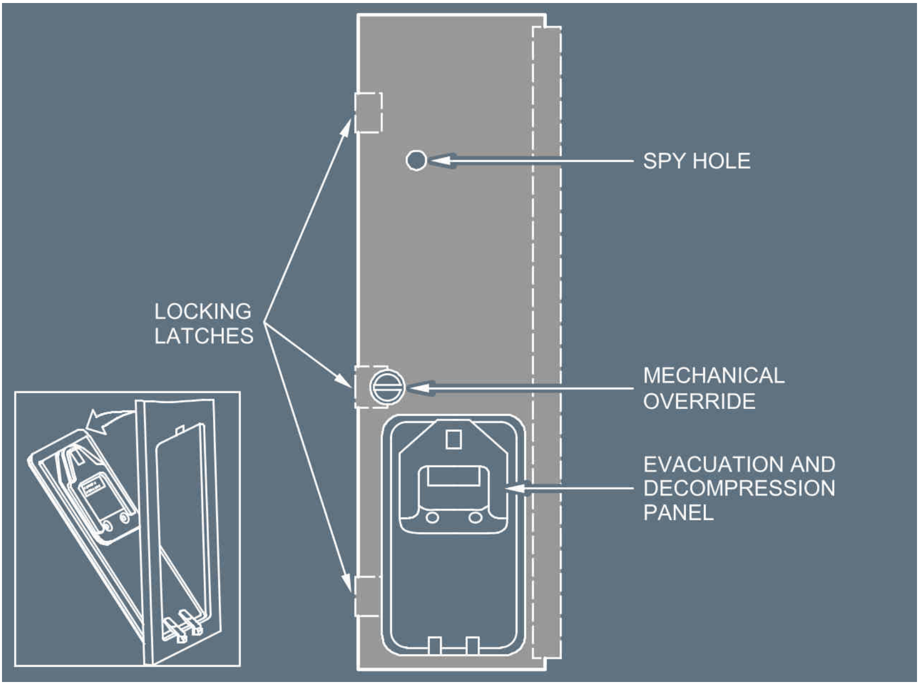
A mechanical override enables the flight crew to open the door from the cockpit side.

The evacuation and decompression panel enables the flight crew to evacuate the cockpit, in case of an emergency, when the door is jammed or stuck.

This panel can only be removed from the cockpit side by kicking it open.

The panel also automatically falls open, in case of rapid cabin decompression (in case of rapid decompression in the cockpit, the CDLS automatically unlocks the door).

In case of an electrical supply failure, the door is automatically unlocked, but remains closed.



A deadbolt ◁ located near the center latch area of the cockpit door, enables to bolt the door from the cockpit side, in the event that more than one locking latch strike fails, or in the case of a total CDLS failure.
A Circuit Breaker (C/B) box, is installed on the left-hand side of the door frame.
This C/B box has three C/Bs. Each C/B is connected to one cockpit door electrical latch.

COCKPIT DOOR DESCRIPTION

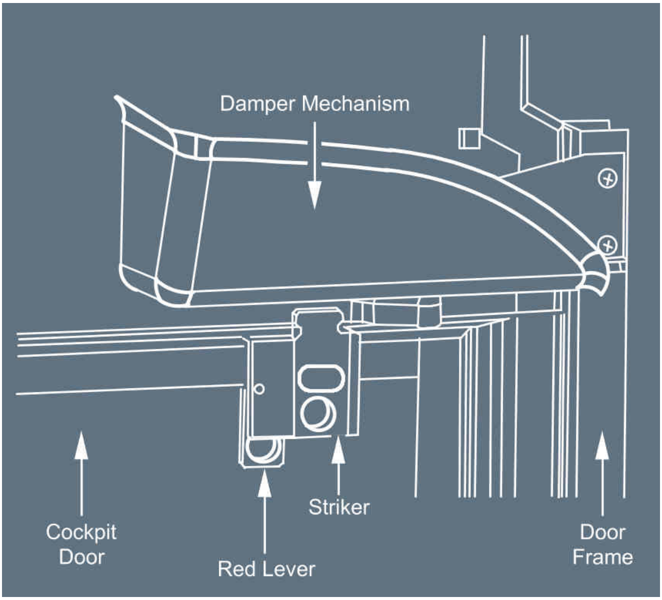
COCKPIT DOOR DAMPER

Ident.: DSC-52-30-10-00014315.0001001 / 11 MAY 12
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

The cockpit door has a noise damper installed on its top right corner, on the cockpit side.
The damper slows down the door during closing.

In the case of a damper blockage, to disengage the damper, the flight crew has to:
- rotate the red lever up
- pull the striker down until it aligns with the door edge, and
- rotate the red lever back down to lock the striker in the down position.



DESCRIPTION

Ident.: DSC-52-30-20-00019042.0005001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The Cockpit Door Locking System (CDLS) provides a means of electrically locking and unlocking the cockpit door. This system is mainly composed of:

- A keypad, located in the forward cabin, near the cockpit door,
- A toggle switch, located on the center pedestal's Cockpit Door panel,
- A control unit and its CKPT DOOR CONT normal panel, located on the overhead panel,
- A backup control unit, identical to the first one, and its CKPT DOOR CONT backup panel, located on the overhead panel,
- An additional CKPT DOOR BKUP panel, which is composed of a LKG SYS switch and a OPEN/FAULT control pushbutton,
- A buzzer.

The keypad enables the cabin crew to request access to the cockpit. There are two different access request types: “Routine” and “Emergency” access request.
The toggle switch enables the flight crew to lock or unlock the cockpit door, following an access request, thereby allowing or denying entry into the cockpit.

The cockpit door control unit is the system controller, in charge of:

- Locking or unlocking the door latches, upon flight crew action.
- Unlocking the door, in case of cockpit decompression (the door then opens towards the cockpit under differential pressure).
- Indicating system failures of electrical latches and pressure sensors.
- Activating the access request buzzer and turning on the keypad LEDs.

The CDLS backup control unit is a backup for locking/unlocking the door by flight crew action, and for unlocking the door in case of decompression. The backup control has to be used only when the normal control unit has failed, or when the two pressure sensors have failed.

When operating the CDLS with the backup control unit, both the toggle switch and the keypad are inoperative. In this condition:

- The cabin crew has to use the interphone to perform any cockpit access request, and
- The flight crew has to use the OPEN/FAULT CTL P/B located on the CKPT DOOR BKUP overhead panel, to unlock the door when access to the cockpit is authorized.
- No emergency access from the cabin to the cockpit is available.

By using the CKPT DOOR BKUP LKG SYS selector, it is possible to operate the CDLS in normal condition, in backup condition, or to deactivate the system to facilitate maintenance tasks and ground operations.

The buzzer sounds in the cockpit for 1 to 9 s to indicate that a routine access request has been made, or sounds continuously if an emergency access procedure has been initiated.

DESCRIPTION

Ident.: DSC-52-30-20-00019042.0001001 / 20 MAR 17
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

The Cockpit Door Locking System (CDLS) provides a means of electrically locking and unlocking the cockpit door. This system is mainly composed of :
- A keypad, located in the forward cabin, near the cockpit door,
- A toggle switch, located on the center pedestal's Cockpit Door panel,
- A control unit and its CKPT DOOR CONT normal panel, located on the overhead panel,
- A buzzer.
- A CKPT DOOR LKG SYS sw ◁✱ located on the overhead panel.

The keypad enables the cabin crew to request access to the cockpit. There are two different access request types : “Routine” and “Emergency” access request.
The toggle switch enables the flight crew to lock or unlock the cockpit door, following an access request, thereby allowing or denying entry into the cockpit.

The cockpit door control unit is the system controller, in charge of :
- Locking or unlocking the door latches, upon flight crew action.
- Unlocking the door, in case of cockpit decompression (the door then opens towards the cockpit under differential pressure).
- Indicating system failures of electrical latches and pressure sensors.
- Activating the access request buzzer and turning on the keypad LEDs.

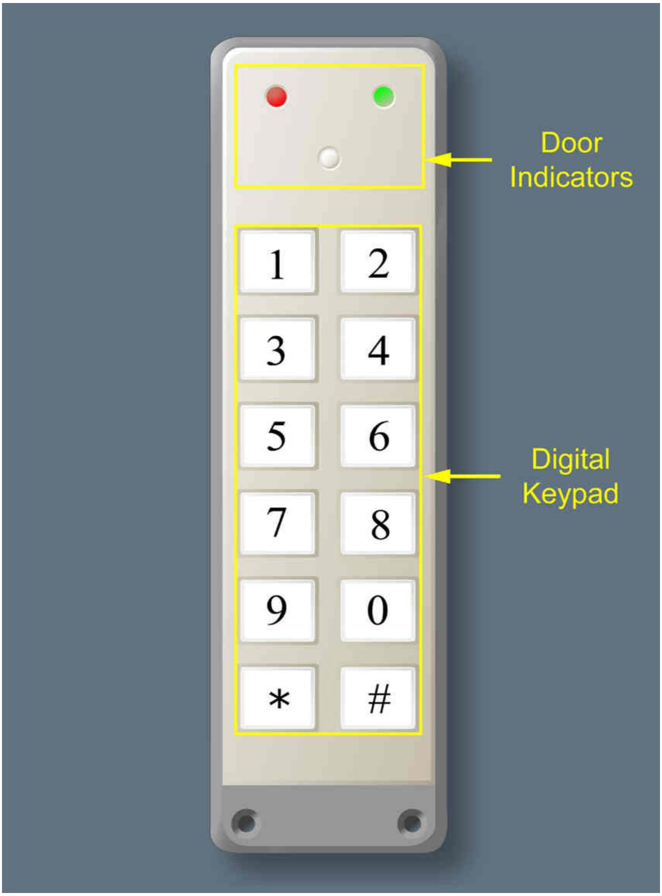
The buzzer sounds in the cockpit for 1 to 9 s to indicate that a routine access request has been made, or sounds continuously if an emergency access procedure has been initiated.
The CKPT DOOR LKG SYS sw enables the CDLS to be switched off, to facilitate maintenance tasks and ground operations.

CONTROLS

Ident.: DSC-52-30-20-10-00000145.0002001 / 03 MAY 23
Applicable to: ALL

KEYPAD

The keypad is used by the cabin crew to request flight crew to open the door.



DOOR INDICATORS

Green LED Steady: The door unlocks after 2 s, and can be opened.

Note: *The flight crew sets the CKPT DOOR sw to UNLOCK, or the cockpit door unlocks automatically for 5 s after an emergency access request.*

Green LED Flashing: A crewmember entered the emergency access code on the keypad.

Red LED Steady: The door is locked, and cannot be opened. The keypad is inhibited for a predefined period of time.

Note: *The flight crew sets the CKPT DOOR sw to LOCK.*

The Operator defines the inhibition time (between 5 min and 20 min).

White LED ⊲✱ On: When any key is pressed.

DIGITAL KEYPAD

The keypad is used to sound the buzzer in the cockpit for one to nine seconds (3 s by default), by entering a zero to seven-digit code, as programmed by the airline, followed by the '#' key.
It is also used to enter the two to seven-digit emergency code, followed by the '#' key, when the flight crew does not respond.

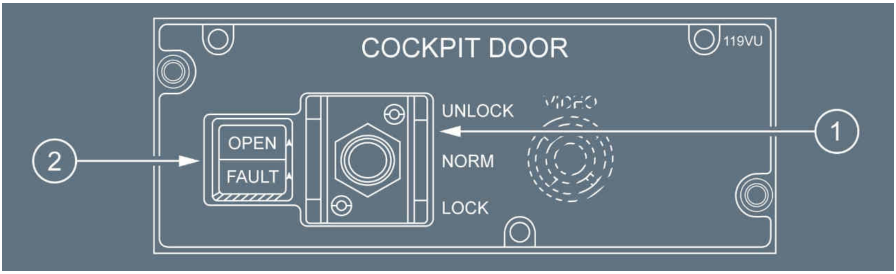
Note: *During the test performed by the cockpit door control unit, the CDLS keypad remains operational, and the CDLS operates as follows:*

The control unit will store access codes that are entered, and the LOCKED/UNLOCKED DOOR INDICATOR (RED/GREEN LEDs) of the keypad will remain on, as long as the test is running:
- *If the correct access code is entered on the keypad, the buzzer will not sound, until the test is completed*
- *If the emergency access code is entered, the door will unlock. The cockpit buzzer and the LOCKED/UNLOCKED DOOR INDICATOR will be inoperative.*

Ident.: DSC-52-30-20-10-00000150.0001001 / 20 MAR 17
Applicable to: ALL

CENTRAL PEDESTAL COCKPIT DOOR PANEL

The secured cockpit door opening is controlled by a toggle switch, located on the central pedestal.



(1) COCKPIT DOOR sw

UNLOCK position	:	This position is used to enable the cabin crewmember to open the door. The switch must be pulled and maintained in the unlock position until the door is pushed open.
NORM position	:	All latches are locked, and EMERGENCY access is possible for the cabin crew.
LOCK position	:	Once the switch has been moved to this position, the door is locked; emergency access, the buzzer, and the keypad are inhibited for a preselected time (5 to 20 min).

Note:
1. *If the LOCK position has not been used by the pilot, for at least 5 to 20 min, the cabin crew is able to request emergency access to open the cockpit door.*
2. *The UNLOCK position overrides and resets any previous selection.*
3. *In case of an electrical supply failure, the cockpit door is automatically unlocked, but remains closed.*

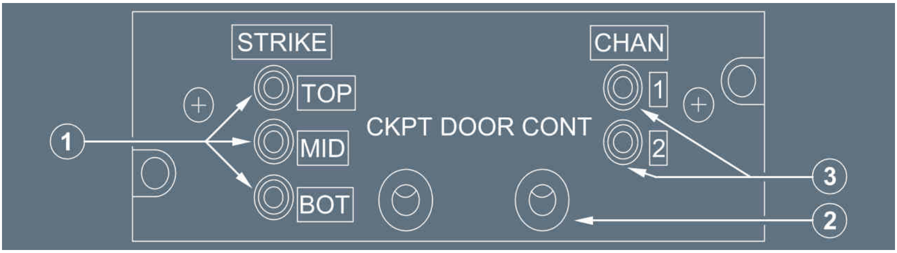
(2) COCKPIT DOOR Fault Open

OPEN light ON	:	The door is not closed.
OPEN light flashes	:	The cabin crew has started an emergency access procedure. If there is no reaction from the flight crew, the door will unlock at the end of the adjustable time delay (15 to 120 s).
FAULT	:	This light comes on when a system failure has been identified (Example: Latch, pressure sensors, control unit). The inoperative item can be identified by checking the strike and pressure sensor status lights on the CKPT DOOR CONT panel.

Ident.: DSC-52-30-20-10-00000155.0001001 / 09 OCT 12
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

OVERHEAD CONTROL PANEL

The cockpit door locking system's control panel is located on the overhead panel.



(1) Strikes' status lights

Off : The corresponding (upper, mid, or lower) locking latch is operative.

On : The corresponding (upper, mid, or lower) locking latch is faulty.

(2) Pressure sensor

Two redundant differential pressure sensors enable rapid pressure variation in the cockpit to be detected, in order to command simultaneous opening of all latches when a defined pressure drop is detected.

(3) Pressure sensor status lights

Off : The corresponding (1 or 2) pressure sensor is operative.

On : The corresponding (1 or 2) pressure sensor is faulty.

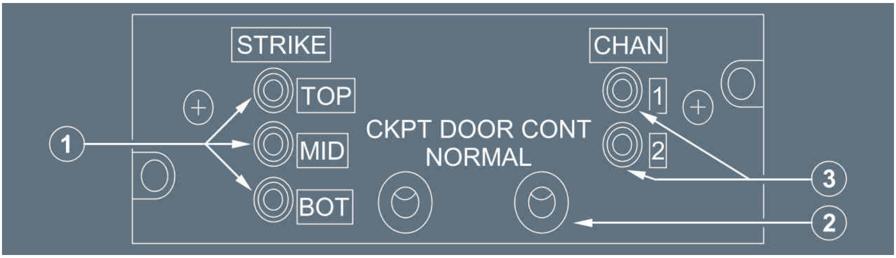
Note: These indicators enable the crew to identify the faulty item, when the Central Pedestal Fault indicator light is ON.

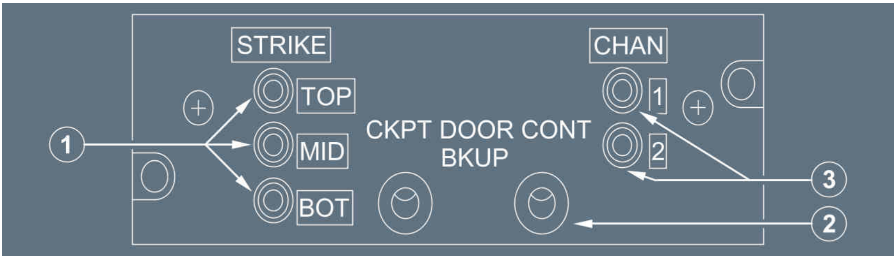
Ident.: DSC-52-30-20-10-00000155.0002001 / 09 OCT 12

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

OVERHEAD CONTROL PANEL

The CDLS consists of two separate but identical control units and, therefore, there are two CKPT DOOR CONT panels (normal and backup). The normal control panel is located on the overhead left-hand side, whereas the backup is located on the right-hand side.





(1) Strikes' status lights

Off : The corresponding (upper, mid, or lower) locking latch is operative.

On : The corresponding (upper, mid, or lower) locking latch is faulty.

(2) Pressure sensor

Two redundant differential pressure sensors enable rapid pressure variation in the cockpit to be detected, in order to command simultaneous opening of all latches when a defined pressure drop is detected.

(3) Pressure sensor status lights

Off : The corresponding (1 or 2) pressure sensor is operative.

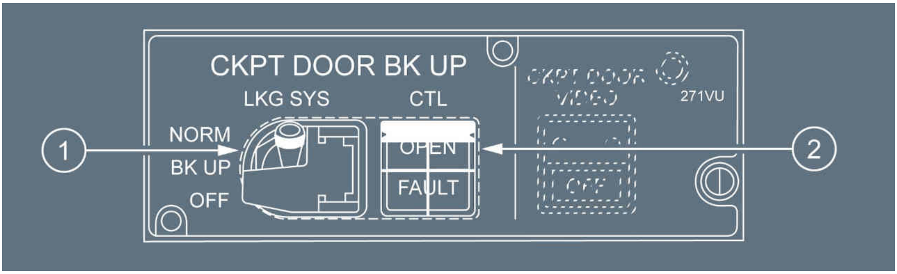
On : The corresponding (1 or 2) pressure sensor is faulty.

Note: *These indicators enable the crew to identify the faulty item, when the CDLS Fault indicator light is ON, (either for the normal or backup system).*

Ident.: DSC-52-30-20-10-00019214.0007001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

COCKPIT DOOR BACKUP

The Cockpit Door Backup control panel has a guarded, three-position switch, and a CTL pushbutton with a dual visual indicator.



(1) LKG SYS selector

NORM : The basic system has no failure; the normal control is operative.

BK UP : Normal control is deactivated, and Backup control is activated.

OFF : The Cockpit Door Locking System is deactivated. Both normal and backup controls are inoperative. Therefore, the door is unlocked. It can be pushed open from the cabin side.

(2) CTL guarded pushbutton, OPEN/FAULT indicator

OPEN P/B	Pressing this pushbutton unlocks the door. Keep the pushbutton pressed, until the door is pushed open.
OPEN light ON	The door is not closed.
FAULT ON	This light comes on, when a backup system failure has been identified. The inoperative item can be identified by checking the strike and pressure sensor status lights on the CKPT DOOR CONT backup panel.

Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

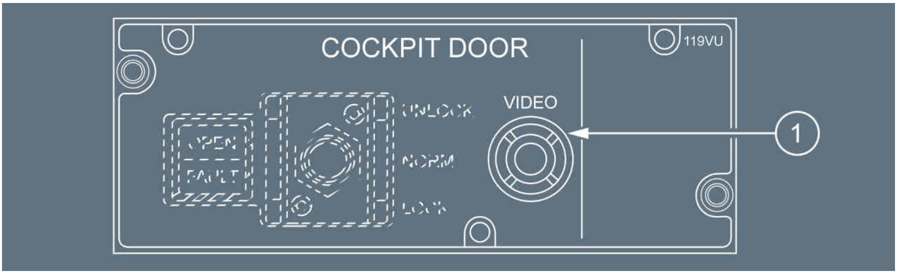
CENTRAL PEDESTAL

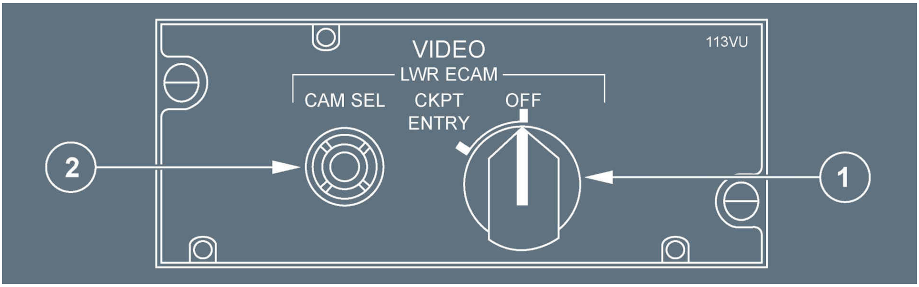


(1) Video pb
Selects the various camera image displays:

Camera 1 image	:	Displayed by pressing the pushbutton when the screen is on standby, or after Camera 2 and 3 images have been displayed. Automatically displayed, after an entry request is performed on the keypad.
Camera 2 and 3 images	:	Displayed on a split screen, when the pushbutton is pressed after Camera 1's image has been displayed.
Standby	:	If no action has been taken for 5 min, the screen goes blank and remains on standby.

Note: An entry request, performed on the keypad within 30 s following an earlier entry request, will not lead to the automatic selection of Camera 1, since the flight crew is given authority to select any desired camera image via the cockpit door video pushbutton. After these 30 s, the system reverts to its normal operation.

Ident.: DSC-52-30-30-10-00019218.0004001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO



(1) LWR ECAM knob

CKPT ENTRY	:	The lower ECAM display displays the camera 1 image.

The camera images are not displayed on the Lower ECAM display in the case of:
- A subsequent automatic system page call following a warning, caution or advisory, or
- A subsequent manual selection of a system page on the ECAM Control Panel (ECP), or
- A SD failure, or
- An E/WD failure.

OFF	:	The lower ECAM display operates normally.

(2) LWR ECAM CAM SEL pushbutton

Selects various camera image displays, when the LWR ECAM knob is set to the CKPT ENTRY position.

The image from camera 1 appears:
- Automatically, when the LWR ECAM knob is set to the CKPT ENTRY position
- When images from cameras 2 and 3 are displayed, and after the flight crew presses the LWR ECAM CAM SEL pushbutton
- Automatically, when images from cameras 2 and 3 are displayed, and after a crew member uses the cabin keypad to make an entry request at least 30 s after a previous entry request.

Images from cameras 2 and 3 are displayed simultaneously on a split screen, when the image from camera 1 is displayed, and after the flight crew presses the LWR ECAM CAM SEL pushbutton.

Note: *1. The message “PLEASE WAIT” is displayed during the transition between two video images when the flight crew requests an image change.*
2. The message “VIDEO NOT AVAIL” is displayed when the flight crew selects a video image change and no video image can be displayed.

HOW TO OPERATE THE COCKPIT DOOR

Ident.: DSC-52-40-00020452.0001001 / 17 MAR 17
Applicable to: ALL

The secured cockpit door operation is controlled by a toggle sw that is located on the COCKPIT DOOR panel (central pedestral).

DOOR OPENING FROM THE COCKPIT

To enable access to the cockpit, set and maintain the COCKPIT DOOR sw to the UNLOCK position until the door is fully opened. When the door is fully opened, the COCKPIT DOOR sw can be released to the NORM position.

DOOR CLOSING FROM THE COCKPIT

Close the door and check that the OPEN indicator goes off. If the COCKPIT DOOR sw is in the NORM position, the door is locked and emergency access is possible from the cabin. When the door is fully closed, if the cockpit door FAULT light is ON, *Refer to PRO-ABN-DOOR [QRH] COCKPIT DOOR FAULT*

Note: *If the OPEN indicator is ON when the door is closed, the door may be unlocked. Repeat the above-mentioned opening/closing procedure.*

When the COCKPIT DOOR sw is in the LOCK position the door is locked. In this position, the emergency access, the buzzer, and the keypad are inhibited for a preselected time (5 to 20 min).

ROUTINE ACCESS TO THE COCKPIT FROM THE CABIN (I.E. NORMAL ACCESS)

To request access to the cockpit from the cabin, use the keypad to enter the code and validate with the "#" key.

L2 The Operator defines this code (between 0 and 7 digits).

L1 The buzzer sounds in the cockpit for 1 to 9 s (3 s by default).
After identification of the person (using the Cockpit Door Surveillance System ◁) that requests access, set the COCKPIT DOOR sw to UNLOCK position to unlock the door. A steady green light on the keypad comes on, that indicates that the door is unlocked.
If the flight crew refuses access to the cockpit by setting the COCKPIT DOOR sw to LOCK position, a steady red light on the keypad comes on, that indicates that the door is locked. The keypad and the buzzer are inhibited for a defined period of time.
If the flight crew does not respond, the door remains locked. If the flight crew does not take any action after a routine cabin request, the cabin crew will be able to open the door with the emergency access procedure.

EMERGENCY ACCESS FROM CABIN TO THE COCKPIT

To request emergency access to the cockpit, use the keypad to enter the emergency code and validate with the "#" key.

L2 The Operator defines this emergency code (between 2 and 7 digits).

L1 The buzzer continuously sounds in the cockpit and the OPEN light flashes on the COCKPIT DOOR panel (central pedestal). In the cabin, the green light on the keypad flashes until the flight crew uses the COCKPIT DOOR sw to either lock or unlock the cockpit door.
After identification of the person (via the Cockpit Door Surveillance system) that requests access, use the COCKPIT DOOR sw to unlock the door.
If the flight crew refuses access by setting the COCKPIT DOOR sw to LOCK position, the keypad and the buzzer are inhibited for a defined period of time.
If the flight crew does not respond, after a preselected time between 15 and 120 s, the door automatically unlocks for 5 s and a steady green light on the keypad comes. The buzzer stops and indicates that the door is unlocked.

EVACUATION THROUGH THE DECOMPRESSION AND EVACUATION PANEL

Pull the quick-release pins of the escape panel towards the center of the flap. Kick the escape panel toward the cabin and evacuate the cockpit.

HOW TO OPERATE THE FWD AND AFT CARGO DOOR

Ident.: DSC-52-40-00020423.0001001 / 28 MAY 20
Applicable to: ALL

NORMAL OPERATION

OPENING

On the cargo door, push the handle flap inward to release the door handle from the catch of the door structure. Then, pull the door handle away and upward from the LOCKED to the UNLOCKED position.

Note: *All indicator flags at the lower section of the door move out from the door contour. These flags provide a visual indication that the cargo door is unlocked.*

Check the differential pressure before the operation of the latching handle.

WARNING	Before operating the latching handle, check the differential pressure. If the red indicator light flashes, do not open the cargo door as an overpressure may exist in the cargo hold.

To unlatch the cargo door, first press the pushbutton on the latching handle, then pull the handle down to the UNLATCHED position.
Open the access door of the door service panel to get access to the selector valve lever. Set the selector valve lever to the OPEN position and maintain the lever in this position until the green indicator light comes on. The green indicator light indicates that the door is fully open and locked.

Note: *The yellow hydraulic system is pressurized (the YELLOW ELEC PUMP is energized). The operation of the flight controls is inhibited.*

When the cargo door is fully open, release the selector valve lever. When released, the lever returns to the neutral (STOP) position and shuts down the electrical pump after 10 s.

CAUTION	Check that the lever is in the neutral position and the pump operation has stopped. Continuous operation of the electrical pump leads to overheat.

CLOSING

To close the cargo door, set the selector valve lever to the CLOSE position and maintain the lever in this position until the green indicator light goes off. This indicates that the door is fully closed and locked.

Note: *At first the selector valve lever locks in an intermediate position, maintaining a preset pressurization to prevent the door from dropping open.*

When the door is fully closed, release the selector valve lever. The lever returns to the neutral position and shuts down the yellow hydraulic electrical pump.

Note: *Release the lever within 1 min after door closure.*

On the cargo door, push the latching handle back into its cavity. Push the door locking handle downward to the LOCKED position.
When the door is locked, the CARGO door indication on the ECAM goes off, and the handle flap mechanism locks the operating handle.
Close the access door of the door service panel.

HOW TO OPERATE THE FWD AND AFT CARGO DOORS (AUXILIARY OPERATION)

Ident.: DSC-52-40-00020425.0002001 / 17 MAR 17
Applicable to: ALL

AUXILIARY OPERATION

In case of an electrical failure or if the yellow hydraulic electric pump fails, the operator can open or close the forward and the aft cargo doors by using the hand pump which is accessible via the ground service panel.

Note: *Two persons are necessary for this operation.*

MANUAL OPENING

To open the cargo door by using the hand pump, unlock the cargo door by using the operating handle as for normal operation.
Open the yellow hydraulic ground service panel that is located in the belly fairing area. Ensure that the selector valve lever is in the CLOSE position.

Open the access door of the door service panel. Set the selector valve lever to the OPEN position and maintain the lever in this position during the operation of the hand pump.
Operate the hand pump until the cargo door is in the fully open position.
When the cargo door is fully open the green light on the door service panel comes on, or the operation of the hand pump suddenly becomes difficult.
Release the selector valve lever of the door service panel. Then, set the selector valve lever (of the ground service panel) to the OPEN position.

MANUAL CLOSING

To close the cargo door, set the selector valve lever (on the door service panel) to the CLOSE position and maintain the lever in this position.
Operate the hand pump until the cargo door is in the fully closed position.
When the cargo door is fully closed, release the lever of the manual selector valve of the door service panel.
Lock the cargo door by using the operating handle as for normal operation.
Close the access door of the door service panel and of the ground service panel.

HOW TO OPERATE THE BI-FOLDING LAVATORY DOOR IN EMERGENCY OPERATION

Ident.: DSC-52-40-00020454.0001001 / 05 JAN 21
Applicable to: ALL

Refer to CCOM/03-080-50-30 How to Open and Remove a Bi-folding Door from the Outside when Locked

HOW TO LEAVE THE AIRCRAFT VIA THE ACCESS DOOR IN THE AVIONICS BAY

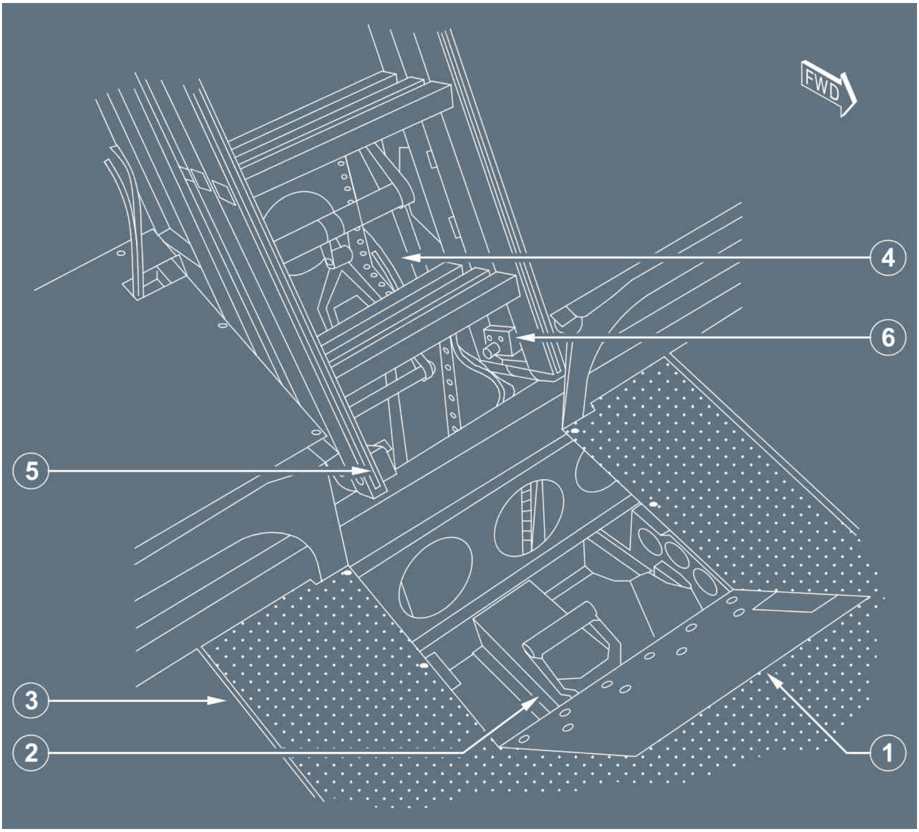
Ident.: DSC-52-40-00020453.0001001 / 17 MAR 17
Applicable to: ALL

In order to open the floor hatch to get access to the avionics bay, move entirely forward the captain seat. Then, descend into the avionics bay and take a position on the right side of the access door that is located in the avionics bay.

Note: *Do not try to open the access door while standing on it.*

When inside the avionics bay, open the floor panel (1) which covers the avionics bay access door handle (2), located at the aft, center part of the access door (coin may be needed to open the lock).
In order to open the access door (3), lift the handle (2) and pull the door completely into the bay until it is latched in its upper stop (LH).
Then, remove the strap which fixes the ladder assembly against motion. Lift the lever (4), located on the right side aft of the lower rung of the aft ladder element, to unlock the ladder assembly and swing it simultaneously towards the opening.

Release the lower locking device on the right inner side of the first ladder element (5) by pulling the orange handle forward (indicated on a placard next to the locking device). Then lower the element until it latches.
Repeat the above steps with the second ladder element (locking device (6) is at the left inner side).
If the ladder does not touch the ground yet, the last element is lowered by pulling forward its orange handle at the lower end on the left outer side.
If the ladder touches the ground leave the aircraft via the extended ladder.



Intentionally left blank

ERRONEOUS ACTIVATION OF THE CABIN PRESSURE WARNING LIGHTS WITHOUT RESIDUAL DIFFERENTIAL PRESSURE

Ident.: DSC-52-100-00023965.0001001 / 02 DEC 19
Applicable to: ALL

DESCRIPTION

At touchdown, the CPCS automatically operates the opening of the OFV to reduce the differential pressure to a safe level, even when both packs are operating.
However the differential pressure sensor may have a defect. The CABIN PRESSURE WARNING lights may temporarily come on without residual differential pressure. In that case, the CAB PR EXCESS RESIDUAL PR alert may not trigger.
This erroneous activation of the CABIN PRESSURE WARNING lights can last up to 30 min.

OPERATIONAL RECOMMENDATION

Before the cabin crew opens the cabin door, the flight crew must confirm the absence of residual differential pressure. The flight crew must wait for CABIN PRESSURE WARNING lights to stop flashing, or perform both of the following actions:

- Check that both air conditioning packs are set to OFF, and
- Open one of the cockpit sliding windows.

If the flight crew cannot open one of the cockpit sliding windows, it means that residual pressure remains. Therefore the cabin doors MUST NOT BE OPENED. In this case, the flight crew may regularly try to open the cockpit sliding window, to confirm the absence of residual pressure.
If the flight crew can open one of the sliding windows, the flight crew can consider the CABIN PRESSURE WARNING lights as spurious. The flight crew can therefore order the cabin crew to open the cabin doors.

The cockpit has fixed and sliding windows.

Intentionally left blank

FIXED WINDOWS

Ident.: DSC-56-20-00000116.0001001 / 17 MAR 17
Applicable to: ALL

There are four fixed windows :
- two windshields
- two fixed side windows

Intentionally left blank

SLIDING WINDOWS

Ident.: DSC-56-30-00000122.0001001 / 09 OCT 12
Applicable to: ALL

The flight crew can use the sliding window as emergency exits. Therefore they are not permitted to stow any object so that it protrudes into the window area from the side console.
Each sliding window includes a panel which as an anti-icing and defogging system, and the opening and closing mechanism.

OPENING MECHANISM

Fully press the operating lever to disengage the locking pins from their latches.
Rotate aft the operating lever to free the window panel from its fixed structure.
At the end of the operating lever travel, pull backwards to slide the window panel aft.
Move control lever forward lock the window.

CLOSING MECHANISM

Move control lever aft unlock the window.
Push operating lever forward until the panel is in position opposite its fixed frame.
Rotate the operating lever forward to move the panel into its frame and engage the locking pins in their latches.

COCKPIT WINDSHIELD AND WINDOWS DESCRIPTION

All cockpit windows are fail-safe design.
The windows are made of:

- A non structural ply, the Outer ply (1), which is only a protective layer
- Two structural plies, the Middle ply (2) and the Inner ply (3)
  Each structural ply is able to sustain individually the pressurization loads
- A heating film (4) to defog and/or de-ice the windshield/window
- Two interlayers (5).

OVERVIEW

Ident.: DSC-70-05-10-00018999.0005001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

The aircraft has two Rolls-Royce Trent 700 engines that supply power to the aircraft.

Ident.: DSC-70-05-10-00018999.0002001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The aircraft has two General Electric CF6-80E1 engines that supply power to the aircraft.

Ident.: DSC-70-05-10-00019000.0001001 / 21 MAR 16
Applicable to: ALL

The engines are turbofan engines that have:

- A high bypass ratio,
- A Full Authority Digital Engine Control (FADEC),
- A fuel system,
- An oil system,
- An air system,
- A thrust reverser system,
- An ignition system and a start system.

ENGINE

Ident.: DSC-70-10-10-10-00019001.0002001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

The engine has:

- Three compressor turbine assemblies:
  - The Low Pressure (LP) compressor turbine assembly,
  - The Intermediate Pressure (IP) compressor turbine assembly,
  - The High Pressure (HP) compressor turbine assembly.

L2 Each turbine operates its associated compressor via a shaft.

L1
- One accessory gearbox,
- One combustion chamber.

The engine operates as follows:

1. The LP compressor, referred to as the fan, compresses the air.
2. Then, the air is divided into two flows:
   - Most of the air flows out of the core engine, and provides most of the engine thrust,
   - The remaining air enters the core engine.
3. The IP and the HP compressors compress the air that enters the core engine.
4. The fuel is added to and mixed with the compressed air of the core engine. The mixture is ignited in the combustion chamber.
5. The gas that results from combustion drives the HP, the IP, and the LP turbines.

The rotation speed of the fan provides the N1 engine parameter.
The rotation speed of the IP rotor provides the N2 engine parameter.
The rotation speed of the HP rotor provides the N3 engine parameter.
The N1 and N3 engine parameters appear on the Engine/Warning Display (E/WD).
The N2 engine parameter appears on the ENG SD page.
L2 The N1, N2 and N3 engine parameters are current rotation speeds displayed in percentage.
L1 The FADEC uses:

- The N1 engine parameter to compute the applicable engine thrust,
- The N1, N2 and N3 engine parameters for engine control and monitoring.

LP COMPRESSOR TURBINE ASSEMBLY

The LP compressor turbine assembly has:

- One LP compressor, referred to as the fan,
- L2 One LP shaft,
- L1 One LP turbine.

L2 The LP shaft connects the fan to the LP turbine.

L3 The LP compressor (fan) has a single stage, and the LP turbine has 4 stages.

Ident.: DSC-70-10-10-10-00019004.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

LP COMPRESSOR TURBINE ASSEMBLY

The LP compressor turbine assembly has:

- One LP compressor,
- L2 One LP shaft,
- L1 One LP turbine.

L2 The LP shaft connects the LP compressor to the LP turbine.
L3 The LP compressor has a fan and 4 stages, and the LP turbine has 5 stages.

Ident.: DSC-70-10-10-10-00019005.0001001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

IP COMPRESSOR TURBINE ASSEMBLY

The IP compressor turbine assembly has:

- One IP compressor,
- L2 One IP shaft,
- L1 One IP turbine.

L2 The IP shaft connects the IP compressor to the IP turbine.
L3 The IP compressor has 8 stages, and the IP turbine has a single stage.
To optimize and protect the operation of the engine at all power settings and in all flight conditions, the Variable Inlet Guide Vanes (VIGVs) and the Variable Stator Vanes (VSVs) regulate the quantity of air that flows through the IP compressor.

Ident.: DSC-70-10-10-10-00019006.0004001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

HP COMPRESSOR TURBINE ASSEMBLY

The HP compressor turbine assembly has:

- One HP compressor,
- L2 One HP shaft,
- L1 One HP turbine.

L2 The HP shaft connects the HP compressor to the HP turbine.
L3 The HP compressor has 6 stages, and the HP turbine has a single stage.

Ident.: DSC-70-10-10-10-00019006.0002001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

HP COMPRESSOR TURBINE ASSEMBLY

The HP compressor turbine assembly has:

- One HP compressor,
- L2 One HP shaft,
- L1 One HP turbine.

L2 The HP shaft connects the HP compressor to the HP turbine.
L3 The HP compressor has 14 stages, and the HP turbine has two stages.

Ident.: DSC-70-10-10-10-00019007.0001001 / 21 MAR 16
Applicable to: ALL

COMBUSTION CHAMBER

The combustion chamber burns a mixture of fuel and HP air.
The FADEC controls the fuel/air mixture in accordance with the position of the thrust lever and the aircraft operating conditions.
L3 The combustion chamber is an annular assembly with fuel nozzles and two igniters. The combustion chamber is between the HP compressor and the HP turbine.

Ident.: DSC-70-10-10-10-00019008.0001001 / 21 MAR 16
Applicable to: ALL

ACCESSORY GEARBOX

The accessory gearbox drives various accessories with mechanical power via the HP shaft for the operation of the engine and the aircraft systems.
L2 The accessory gearbox of each engine operates:

- The oil feed pump that provides the oil system with oil.
- The main engine fuel pump that provides the combustion chamber with fuel.
- The engine-driven hydraulic pumps that pressurize the GREEN, the BLUE and the YELLOW hydraulic systems.
- The engine-driven generators that are the primary source of electrical power.
- The FADEC alternator that provides the FADEC with electrical power.
- The pneumatic starter that enables the engine start.

GENERAL

Ident.: DSC-70-20-00020632.0001001 / 17 MAR 17
Applicable to: ALL

Each powerplant has a FADEC (Full Authority Digital Engine Control) system.
FADEC is a digital control system that performs complete engine management.
FADEC has two-channel redundancy, with one channel active and one standby.
If one channel fails, the other automatically takes control.
The system has a magnetic alternator for an internal power source.
FADEC is mounted on the fan case.
The Engine Interface Unit (EIVMU/EIU) transmits the data it uses for engine management to the FADEC.

FUNCTIONS

Ident.: DSC-70-20-00020634.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The FADEC system performs the following functions:

Control of gas generation

- Control of fuel flow
- Acceleration and deceleration schedules
- Variable bleed valve and variable stator vane schedules
- Control of turbine clearance
- Idle setting

Protection against engine exceeding limits

- Protection against N1 and N2 overspeed
- Monitoring of EGT during engine start

Power management

- Automatic control of engine thrust rating
- Computation of thrust parameter limits
- Manual management of power, based on thrust lever position
- Automatic power management (A/THR demand)

Automatic engine starting sequence

- Control of the:
  - Start valve
  - HP fuel valve
  - Fuel flow
  - Ignition
- Monitoring of N1, N2, FF and EGT
- Initiation of abort and recycle (on ground only)

Manual engine starting sequence

- Passive monitoring of the engine
- Active protection (on ground only) against high EGT and for starter reengagement speed
- Control of the:
  - Start valve
  - HP fuel valve
  - Ignition

Thrust reverser control

- Actuation of the blocker cowls
- Engine setting during reverser operation

Transmission of engine parameters and engine monitoring information to cockpit indicators

- The primary engine parameters
- The starting system status
- The thrust reverser system status
- The FADEC system status
- Secondary engine parameters (oil temperature, nacelle temperature, oil filter clog and fuel filter clogging)

Fuel used Computation

Fuel flow integration

Management of engine heat

Control of the core compartment cooling valve

Management of IDG heat

Control of the IDG air/oil heat exchanger air valve

Failure detection, isolation and recording

FUNCTIONS

Ident.: DSC-70-20-00020634.0010001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

The FADEC system performs the following functions:

Control of gas generation

- Control of fuel flow
- Acceleration and deceleration schedules
- Variable stator vanes variable inlet guide vanes, and IP/HP bleed valve schedules
- Control of turbine clearance
- Idle setting.

Protection against engine exceeding limits

- Protection against N1 and N2 overspeed (controlled by the overspeed protection unit)
- Turbine overspeed
- Monitoring of EGT during engine start on ground.

Power management

- Automatic control of engine thrust rating
- Automatic reversion to N1 mode
- Computation of thrust parameter limits
- Manual management of power, based on thrust lever position
- Automatic management of power (A/THR demand).

Automatic engine starting sequence

- Control of:
  - The start valve
  - The HP fuel valve
  - The fuel flow
  - The ignition
- Monitoring of N1, N3, FF and EGT
- Initiation of abort and recycle (on ground only)
- Auto relight and quick relight functions.

Manual engine starting sequence

- Passive monitoring of the engine
- Control of:
  - The start valve
  - The HP fuel valve
  - The ignition.

Thrust reverser control

- Actuation of the blocker cowls
- Engine setting during reverser operation.

Transmission of engine parameters and engine monitoring information to cockpit indicators

- The primary engine parameters
- The starting system status
- The thrust reverser system status
- The FADEC system status
- Secondary engine parameters (oil temperature, nacelle temperature, oil filter clog and fuel filter clogging).

Computation of fuel used

Integration of fuel flow.

Management of engine heat

Control of turbine case, bearing and gearbox cooling.

Cooling of FADEC

Detection, isolation and recording of failures

Protection against fan stall

- Modified Engine Acceleration Schedule for Take Off (MEASTO): A logic that ensures a progressive thrust is automatically set during the takeoff roll. Engine acceleration is controlled with an “EPR/second” rate in EPR mode
- Stall recovery logic: When a fan stall is detected, a recovery logic is triggered which consists of a fuel flow reduction and Variable Stator Vanes repositioning. The protection is active until the thrust lever is moved as per ECAM procedure.

Keep out zone logic

To prevent fan instability, this logic avoids stabilized engine operation between the 1.16 to 1.28 EPR range (in N1 rated mode, the keep-out zone depends on the ambient conditions), when on ground with an aircraft speed below 80 kt.

Protection against Intermediate Pressure Turbine overspeed

In the case of an Intermediate Pressure Turbine overspeed, the Intermediate Pressure Turbine Overspeed System (IPTOS) either automatically limits the engine thrust to 30 % of the maximum takeoff thrust, or automatically shuts down the affected engine. This is to protect the system integrity of the Intermediate Pressure Turbine. The IPTOS protection remains active on the affected engine for the remainder of the flight. In the case of one engine inoperative in flight, the IPTOS protection is automatically inhibited on the remaining engine (when the thrust lever is set to, or above, MCT for at least 4 s).

GENERAL

Ident.: DSC-70-30-10-00020655.0001001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

A FADEC dedicated to each engine controls the thrust.
The pilot uses the thrust levers to set the thrust in manual mode, and the FMGS sets the thrust in automatic mode.
The FADEC prevents the thrust from exceeding the limit for the thrust lever position in both manual and automatic modes.

The thrust levers can only be moved manually.
The range of movement is divided into 3 operating segments.
The sector has 4 positions defined by detents or stops.
Thrust lever position is transmitted to the FADEC which computes and displays the thrust rating limit and the N1 TLA.

MANUAL MODE

Ident.: DSC-70-30-30-00004787.0001001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The engines are in the manual mode provided the A/THR function is:
- not armed or
- armed and not active (thrust lever not in the A/THR operating range and no alpha floor).

In these conditions, each engine is controlled by the position of its thrust lever.
The flight crew controls the thrust by moving the thrust lever from IDLE to TOGA positions. Each position of the thrust lever within these limits corresponds to an N1.

When the thrust lever is in a detent, the corresponding N1 is equal to the N1 rating limit computed by the FADEC for this engine.

POSITION OF THE THRUST LEVER

When the thrust lever is in the MCT/FLX detent :

- **On the ground :**
  The engine runs at the flex takeoff thrust rating if the MCDU has selected a flex takeoff temperature that is higher than the current total air temperature (TAT). Otherwise the engine produces maximum continuous thrust (MCT).

  Note: *A change of FLEX TEMP during the takeoff has no effect on the thrust.*

- **After take-off :**
  The flight crew can change from FLX to MCT by moving the thrust lever to TOGA or CL, then back to MCT. After that, the flight crew cannot use the FLX rating.

  Note: *Setting the thrust lever out of MCT/FLX detent without reaching TOGA or CL detent has no effect.*

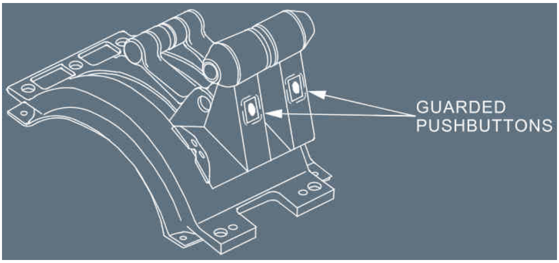
The flight crew can always get MAX TO thrust by pushing the thrust lever all the way forward.
In go-around, the A/THR controls the thrust in accordance with the following thrust lever position:

- At the TOGA detent, the thrust target is the TOGA thrust,
- At the MCT/FLX detent, when TOGA was previously set in the case of soft go-around, the thrust target is one of the following:
  - The thrust to target a vertical speed of approximately 2 000 ft/min, or
  - The maximum thrust (TOGA) if the 2 000 ft/min cannot be reached.

THRUST BUMP

Ident.: DSC-70-30-30-00020643.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

- The thrust bump can be used to obtain an additional thrust capability during takeoff.
- Maximum thrust increase is obtained with the TLA at TOGA position.
- Thrust power is increased by up to 2.5 % (corresponding to an N1 increase up to 1.7 %).
- It is activated by two guarded pushbuttons, that are located on each thrust lever.



- It remains active, in case of one engine failure.

ENGAGEMENT-DISENGAGEMENT

Ident.: DSC-70-30-30-00020790.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

- The thrust bump is engaged by the FADEC, when the following conditions are met:
  - The engines are running (N2 > 50 %)
  - TRA is in the forward thrust region
  - One of the two thrust bump pushbuttons has been pressed.
  - The A/C has been on ground for more than 30 s.
- Disengagement is effective:
  - On ground, by reducing the thrust levers to, or below, MCT
  - On ground, by pressing one of the two bump pushbuttons, if the thrust levers are not at above MCT
  - At engine shutdown.

ACTIVATION-DEACTIVATION

Ident.: DSC-70-30-30-00020791.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

- The thrust bump is activated, when the following condition is met:
  - FLEX takeoff or derated takeoff have not been selected.
- Deactivation occurs:
  - After takeoff, when the thrust lever is at, or below, CLB.

Note:
- *A “B” will appear in green on the right side of the N1 indication, when the bump has been engaged.*
- *The thrust bump is not available, in case of a go-around or touch-and-go.*
- *On ground, once selected, the bump function is engaged for takeoff, when the thrust levers are above MCT. The FADEC will deselect the bump after takeoff, when the thrust lever is at, or below, CLB.*
- *In case of EIVMU failure, after bump engagement, bump condition is maintained in the FADEC.*

GENERAL

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The FADEC computes the thrust rating limit for each thrust lever position, as shown below. If the thrust lever is set in a detent, the FADEC selects the rating limit corresponding to this detent.
If the thrust lever is set between two detents, the FADEC selects the rating limit corresponding to the higher detent.

INDICATIONS ON FMA

The FADECs monitor the positions of the thrust levers, and trigger appropriate indications on the FMA (*Refer to DSC-22_30-80-20 FMA Display*).

GENERAL

Ident.: DSC-70-35-10-00020792.0001001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

A FADEC dedicated to each engine controls thrust.

The pilot uses the thrust levers to set the thrust in manual mode, and the FMGS sets the thrust in automatic mode.

The FADEC prevents the thrust from exceeding the limit for the thrust lever position in both manual and automatic modes.

The engine thrust setting is made through control of the Engine Pressure Ratio (EPR).

EPR = low pressure turbine exhaust pressure / Engine air inlet air pressure.

Intentionally left blank

GENERAL

Ident.: DSC-70-35-20-00020793.0001001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

The FADEC has two modes of power setting, EPR and N1 modes.

EPR MODE

Ident.: DSC-70-35-20-00020803.0001001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

EPR mode is the normal mode to control the thrust.
The required EPR is set by controlling the fuel flow.

The FADEC computes the command EPR as a function of:
- Thrust Lever Angle (TLA)
- Altitude
- Mach number
- Air data (static pressure/temperature, total air pressure/temperature)
- Service bleed.

Note: *During reverse operation, the thrust is controlled as a function of N1.*

N1 MODE

Ident.: DSC-70-35-20-00020804.0005001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

In the event of no EPR available the affected FADEC will automatically revert to N1 mode.
At the reversion to N1 mode, an equivalent thrust to that achieved in EPR mode is provided, until a thrust lever position change.
In case of dispatch in N1 mode, flex take-off is not available.
Depending on the failure case leading to EPR mode loss, the FADEC will revert to either rated or degraded N1 mode.
Autothrust control disengages. However it can be re-engaged if no more than one engine is in degraded N1 mode. ALPHA FLOOR protection remains available if one engine is in degraded N1 mode.

RATED N1 MODE

An automatic reversion to rated N1 mode occurs, when:
- Engine P2 (Engine Inlet Total Pressure) and/or P5 (Engine Low Pressure Turbine Outlet Pressure) are not available, or
- Engine P2 is lower than ADIRS Pt.

The FADEC will compute an EPR COMMAND, depending on the TLA, then convert it into a N1 COMMAND as a function of Mach.
The rated N1 mode can also be manually-selected through the ENG N1 MODE pb-sw on the overhead panel.

DEGRADED N1 MODE

An automatic reversion to degraded N1 mode occurs, when:
- Engine P2 (Engine Inlet Total Pressure) and ADIRS 1 + 2 Pt are not available, or
- Engine T2 (Engine Inlet Total Temperature) and ADIRS 1 + 2 Tt are not available, or
- Engine P0 (Engine Inlet Static Pressure) and ADIRS 1 + 2 Ps are not available.

The N1 is defined as a function of TLA and altitude and is limited by the FADEC to either the smaller of N1 max or N1 redline (if T2 is available), or N1 redline (if T2 is not available).
The N1 DEGRADED MODE is an unrated N1 mode.
The N1 rating limit, N1 TLA, and N1 max indications on ECAM E/WD are lost.
In electrical emergency configuration, the EPR mode is lost on both engines, and each FADEC reverts to an degraded N1 mode.

EPR RECOVERY LOGIC

Ident.: DSC-70-35-20-00004771.0002001 / 25 FEB 14
Applicable to: LV-KHT, LV-KHU

With the FADEC in either rated or degraded N1 mode, switching OFF the ENG N1 MODE pushbutton on the overhead panel will permit to return to the EPR mode, if the failure has disappeared and the aircraft is on ground.

THRUST LEVERS

MANUAL MODE

Ident.: DSC-70-35-50-00001129.0001001 / 03 NOV 21
Applicable to: LV-KHT, LV-KHU

The engines are in the manual mode, provided the A/THR function is:
- Not armed, or
- Armed and inactive (thrust lever not in the A/THR operating range and no alpha floor).

In these conditions, each engine is controlled by its thrust lever position.
The flight crew controls thrust by moving the thrust lever from IDLE to TOGA positions. Each thrust lever position within these limits corresponds to an EPR.
When the thrust lever is in a detent, the corresponding EPR is equal to the EPR rating limit, computed by the FADEC for this engine.

POSITION OF THE THRUST LEVER

When the thrust lever is set in FLX MCT detent :

- **On the ground :**
  The engine runs at the flex takeoff thrust rating, if the MCDU has selected a flex takeoff temperature that is higher than the current total air temperature (TAT).
  Otherwise, the engine produces maximum continuous thrust (MCT).

  Note: A FLEX TEMP change during takeoff has no effect on thrust.

- **After takeoff :**
  The flight crew can change from FLX to MCT by moving the thrust lever to TOGA or CL, then back to MCT. After that, the flight crew cannot use the FLX rating.
  The flight crew can always get MAX TO thrust by pushing the thrust lever all the way forward.

  Note: Setting the thrust lever out of the MCT/FLX detent, without reaching TOGA or CL detent, has no effect.

AUTOMATIC MODE

Ident.: DSC-70-35-50-00020652.0001001 / 18 MAY 22
Applicable to: LV-KHT, LV-KHU

In the autothrust mode (A/THR function active), the thrust is computed by the FMGC and is limited to the value corresponding to the thrust lever position (except if the alpha-floor mode is activated).

The fuel system supplies fuel to the combustion chamber at the required flow rate, pressure, and temperature.
The fuel flows from the tank, via the Main Engine Pump and the fuel/oil heat exchanger, to the Fuel Metering Unit (FMU) and to the fuel nozzles.
Control of fuel supply is made by the FADEC via the FMU. High pressure fuel is also used to provide pressure for some engine component actuators.

MAIN ENGINE PUMP

Ident.: DSC-70-40-20-00001136.0008001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

The HP compressor shaft drives the HP fuel pump assembly. Fuel flows through the LP pump, then through the fuel/oil heat exchanger, a filter, and the HP pump. Fuel then divides into two flows, one for the servovalve actuators, and one for the FMU’s metering valve.

FUEL PUMP UNIT

Ident.: DSC-70-40-20-00001136.0002001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The HP compressor shaft drives the HP fuel pump assembly. Fuel flows through the LP pump, a filter (debris screen), and the HP pump (gear pump), then through the fuel/oil heat exchanger and the main filter. Fuel then divides into two filtered flows, one for the servo-fuel heater and servo-valves of the HMU, and one for the HMU's metering valve.

Intentionally left blank

SHUTOFF VALVES

Ident.: DSC-70-40-30-00020640.0005001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

Setting the ENG MASTER lever to OFF directly commands the closing of the LP and HP fuel shutoff valves for that engine's fuel system.
Upon closure of the HP fuel shutoff valve, the dump valve opens, which enables any remaining fuel from the burners to the drain tank to be purged. During engine start, fuel from the tank is returned to the LP fuel pump.

SHUTOFF VALVES

Ident.: DSC-70-40-30-00020640.0002001 / 10 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Setting the ENG MASTER lever to OFF directly commands the closing of the LP and HP fuel shutoff valves for that engine's fuel system.

Intentionally left blank

GENERAL

Ident.: DSC-70-40-40-00020641.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

The FMU is controlled by the FADEC, and performs :
- Control of the fuel flow to the engine combustion chamber through the Fuel Metering Valve (FMV)
- Overspeed protection by closing the HP shutoff valve
- Actuation of the HP shutoff valve to start, or stop, the engine.

GENERAL

Ident.: DSC-70-40-40-00020641.0001001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The HMU is controlled by the FADEC, and performs :
- Control of the fuel flow to the engine combustion chamber through the Fuel Metering Valve (FMV)
- Overspeed protection for N2 by opening the fuel bypass valve
- Control of the fuel hydraulic signals to actuators.

FUEL FLOW

Ident.: DSC-70-40-40-00001139.0003001 / 09 FEB 18
Applicable to: LV-KHT, LV-KHU

L3 The Fuel Metering Valve (FMV) transforms FADEC orders through a torque motor and servovalve into fuel flow to the engine fuel nozzles.
The FMV resolver generates a feedback signal proportional to the FMV position.
The bypass valve maintains a constant pressure drop across the FMV to ensure that the metered fuel flow is proportional to the FMV position.

OVERSPEED PROTECTION

Ident.: DSC-70-40-40-00020651.0003001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

TURBINE OVERSPEED PROTECTION (TOS)

The FADEC provides protection against LP turbine overspeed, due to LP shaft breakage between compressor and turbine. If it occurs, the engine is shut down by closing the HP shut-off valve.

OVERSPEED PROTECTION UNIT (OPU)

Independent of the FADEC, the engine is fitted with the N1/N2 overspeed protection unit. In the event of overspeed condition detected by the OPU, which occurs when N1 reaches 110 % or N2 reaches 117 % , the OPU controls the engine shutdown by closing the HP shut-off valve.

OVERSPEED PROTECTION

Ident.: DSC-70-40-40-00020651.0001001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Independent of the FADEC, the overspeed governor limits the N2 by opening the fuel bypass valve, in the event of a malfunction that could lead to an overspeed condition.

IDLE CONTROL

Ident.: DSC-70-40-40-00001144.0001001 / 21 MAR 16
Applicable to: ALL

The FADEC has the following three idle modes :

Modulated idle

- Is regulated according to :
  - Bleed system demand
  - Oil temperature
  - Mach number.
- Is selected :
  - In flight, when the flaps are retracted and the gear is up.
  - On ground, provided reverse is not selected.

Approach idle

- Is regulated according to aircraft altitude, regardless of bleed system demand.
- Selected in flight, when the FLAPS are extended to FLAP 2, FLAP 3, or FULL, or when the landing gear is down.
- Allows the engine to rapidly accelerate from idle to go-around thrust.

Reverse idle

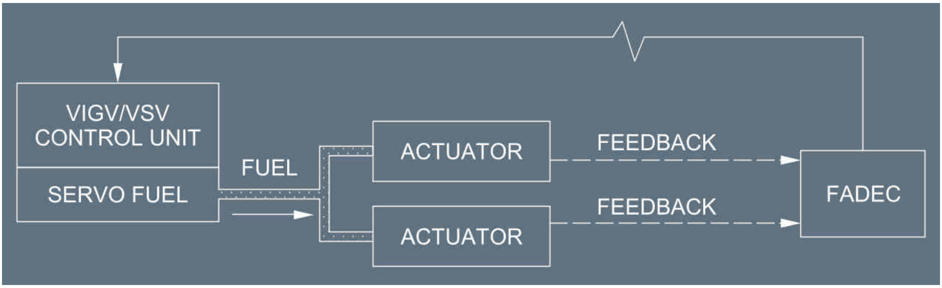
- Selected on ground, when reverse idle thrust is selected.
- Slightly higher than forward idle thrust.

FUEL HYDRAULIC SIGNALS

Ident.: DSC-70-40-40-00001145.0005001 / 09 OCT 12
Applicable to: LV-KHT, LV-KHU

L3 Fuel hydraulic signals are sent to :

- **Air/Oil heat Exchanger Control Valve**
- **Variable Stator Vanes (VSVs) and Variable Inlet Guide Vanes (VIGVs)**
  The FADEC controls the VSV/VIGV system which positions the compressor variable vanes to provide optimum intermediate pressure and high pressure compressor efficiency to prevent surge during transient engine operations.
  VSVs/VIGVs are fully closed at low engine power, and are fully open at high power.
  VIGVs are controlled closed, if the FADEC detects an intermediate pressure or low pressure turbine overspeed.



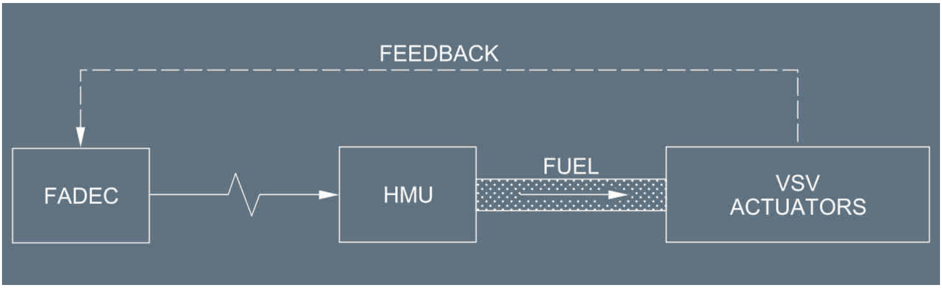
FUEL HYDRAULIC SIGNALS

Ident.: DSC-70-40-40-00001145.0002001 / 09 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

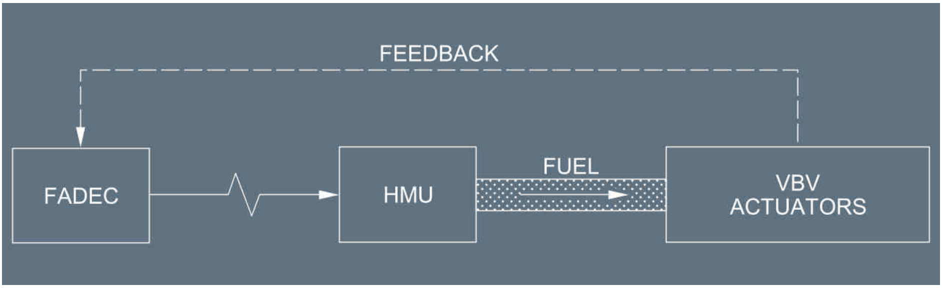
L3 Fuel hydraulic signals go to :

- **Low Pressure Turbine Clearance Control (LPTCC) valves.**
  Refer to DSC-70-60 Cooling
- **High Pressure Turbine Clearance Control (HPTCC) valves.**
  Refer to DSC-70-60 Cooling

- **Variable Stator Vanes (VSV s)**
  The VSVs system positions the compressor variable vanes.
  The FADEC maintains optimum compressor efficiency at a steady state and an adequate stall margin for transient engine operation.
  VSVs are fully closed at low engine power, and are fully open at high thrust.



- **Variable Bleed Valves (VBV s)**
  The FADEC controls the VBVs, upstream of the HP compressor. Their setting depends on compressor inlet temperature and on N2. It varies between full open (start, low thrust, and during fast deceleration) and full closed (high thrust) positions.



Intentionally left blank

GENERAL

Ident.: DSC-70-40-50-00001146.0002001 / 09 OCT 12

HP TURBINE CLEARANCE CONTROL (HPTCC) SYSTEM

The HPTCC system is controlled by the FADEC, through the HMU, and controls the high pressure turbine clearance. The FADEC modulates the fan air flow for the high pressure turbine case cooling.
It provides optimization of high pressure turbine performance and EGT reduction.

LP TURBINE CLEARANCE CONTROL (LPTCC) SYSTEM

The LPTCC system is controlled by the FADEC, through the HMU, and controls low pressure turbine clearance.
The FADEC modulates the fan bleed air flow for the low pressure turbine case cooling.

CORE COMPARTMENT COOLING (CCC) SYSTEM

The CCC system is controlled by the FADEC. The core compartment is cooled and ventilated by fan air thru the CCC valve pneumatically actuated.
The FADEC controls the valve to a low flow position during cruise at normal cruise power settings.

BORE COMPARTMENT COOLING (BCC) SYSTEM

The BCC system is controlled by the FADEC. The bore compartment is cooled and ventilated by fan air thru the three BCC solenoid valves.
FADEC reduces the cooling during cruise.

COOLING

Ident.: DSC-70-60-00001153.0004001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

TURBINE CASE COOLING (TCC)

The TCC system is controlled by the FADEC to improve engine performance by controlling the intermediate pressure turbine blade tip clearance, and cooling intermediate pressure and low pressure turbine cases.
The TCC valve is controlled by the FADEC to modulate air flow depending on flight conditions.
The valve is fully open in cruise for optimal engine performance.

INTERNAL GEARBOX COOLING

The internal gearbox cooling system is controlled by the FADEC to regulate air pressure and temperature within the engine center bearing. The HP 3 air to gearbox is cooled in the Air Cooled

Air Cooler (ACAC) using fan air and modulated by a dual valve controlled by the FADEC. The valve is fully open during hot day take-off and climb conditions.

IDG COOLING

Fan air is used to cool the IDG oil through the air/oil cooler. A bypass valve opens when oil is too cold and cannot flow easily through the cooler.

ENGINE STABILITY

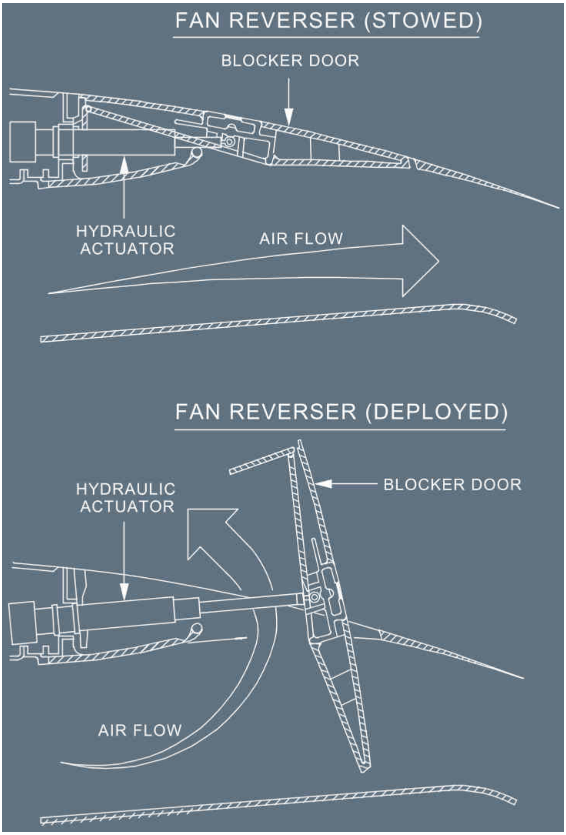
Ident.: DSC-70-60-00001154.0003001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

Two air bleed systems provide greater compressor stability in different flight phases. The volume of airflow through the intermediate pressure and low pressure compressors is regulated by four intermediate pressure stage 8, and three high pressure stage 3, bleed valves controlled by the FADEC. At low engine speed, the bleed valves are open to prevent engine stall.

GENERAL

Ident.: DSC-70-70-00020761.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

The aircraft performs engine reverse thrust via four pivoting blocker doors on each engine to create a deflected fan airstream.



FAN REVERSER (STOWED)
BLOCKER DOOR
HYDRAULIC ACTUATOR
AIR FLOW
FAN REVERSER (DEPLOYED)
HYDRAULIC ACTUATOR
BLOCKER DOOR
AIR FLOW

A hydraulic door jack positions each door.
- The blue circuit powers the doors on engine 1
- The yellow circuit powers the doors on engine 2.

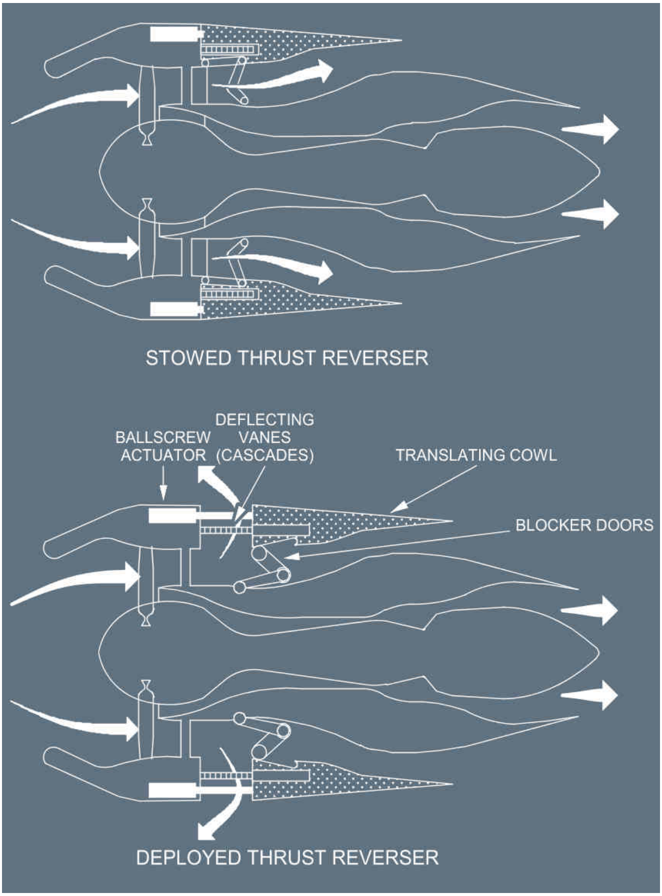
The thrust reverser system is independently controlled for each engine by the associated FADEC. This system is controlled and monitored by each FADEC channel. The translating cowls are hydraulically actuated. The thrust reverser system for each engine includes all of the following:

- Four pivoting blocker doors each activated by an hydraulic actuator
- A hydraulic isolation valve controlled by the FADEC
- A directional control valve, which directs hydraulic pressure to 4 hydraulic locks and to the deploy or stow line
- Four independent electrical locks controlled by the FADEC
- Four stow proximity switches and four lock proximity switches to monitor if the translating cowls are deployed or stowed and locked
- Four tertiary locks (one for each of the pivoting doors) that enable the reverse to be maintained in the locked position via a door pin. During engine reverse thrust, a solenoid enables the door pin to be released.

GENERAL

Ident.: DSC-70-70-00020761.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Reverse thrust is obtained by deflecting the fan airstream. This is done when the translating cowls are fully-deployed backward. This action therefore enables the pivoting blocker doors to divert the fan flow forward through the cascades.



STOWED THRUST REVERSER
BALLSCREW ACTUATOR
DEFLECTING VANES (CASCADES)
TRANSLATING COWL
BLOCKER DOORS
DEPLOYED THRUST REVERSER

The thrust reverser system is independently controlled for each engine by the associated FADEC. This system is controlled and monitored by each FADEC channel. The translating cowls are pneumatically actuated. The thrust reverser system for each engine includes all of the following:

- Two translating cowls, each activated by three ballscrews operated by a single pneumatic motor actuator
- An air supply valve that automatically selects one of the air pneumatic source depending on delivered pressure
- A pressure regulator and shutoff valve to regulate downstream pressure to 90 PSI maximum
- A directional control valve that actuates the pneumatic motor in the deployed/stowed position

- Two stow switches (one per cowl) and two deploy switches (one per cowl) to monitor if the translating cowls are deployed or stowed
- One thrust reverser brake that is spring loaded in the lock position. During engine reverse thrust operation, a solenoid enables the spring to be unloaded.

ACTUATION LOGIC

Ident.: DSC-70-70-00020764.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

Deployment requires :
- TLA reverse signals from FADEC and from the flight control primary computer (PRIM 1 or PRIM 3)
- One FADEC channel that operates with its associated throttle reverse signal
- Aircraft on ground signal from at least one LGCIU.

During deployment, engine reverse thrust is limited to idle, until the reversers are deployed by more than 70 %. Then, FADEC will command full reverse thrust to be available when reversers position are more than 90 % deployed.

ACTUATION LOGIC

Ident.: DSC-70-70-00020764.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Deployment requires :
- One FADEC channel that operates with its associated throttle reverse signal
- Aircraft on ground signal from at least one LGCIU
- TLA reverse signal from the flight control primary computer 1 or 3 (PRIM 1 or PRIM 3).

Before the transit completion of the blocker doors, the FADEC sets reverse idle thrust.

PROTECTION

Ident.: DSC-70-70-00020765.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

AUTO RESTOW FUNCTION AND IDLE PROTECTION

The FADEC will automatically command the engine to idle and the reverser to stow if at least one door is unstowed by more than 5 % and reverse thrust is not selected while engine is running. The affected reverser will remain pressurized after affected door is locked back.
If the door is still detected unstowed, the engine will remain at idle for the remainder of the flight.

PROTECTION

Ident.: DSC-70-70-00020765.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

AUTO RESTOW FUNCTION AND IDLE PROTECTION

The FADEC will automatically command the reverser to stow if at least one door is unstowed and reverse thrust is not selected while engine is running.
The FADEC will automatically select idle thrust if the reverse thrust is not selected and one translating cowl is unstowed by more than 30 % or both cowls are unstowed by more than 15 %.

GENERAL

Ident.: DSC-70-80-10-00020602.0001001 / 28 MAY 20
Applicable to: ALL

The FADEC controls and monitors the ignition and starting system, according to the:
- ENG START selector position
- ENG MASTER lever position
- ENG MAN START pushbutton position
- Flight/ground aircraft condition.

In normal operation, the FADEC receives its inputs from the EIVMU/EIU.
In the event of an EIVMU/EIU signal loss, all the functions, except manual start and wet crank, will remain available by using both a backup signal from the ENG MASTER lever, and the alternate start/ignition signal.

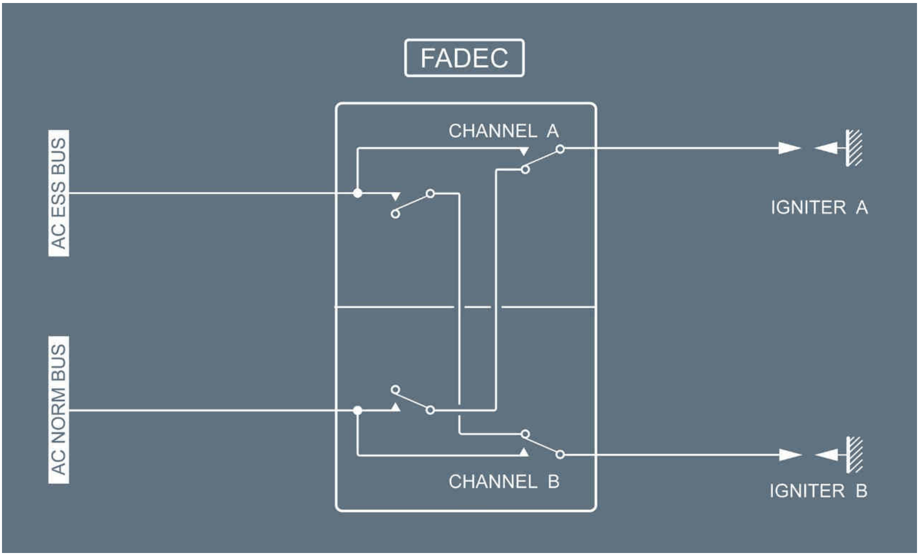
Applicable to: LV-KHT, LV-KHU

The ignition system ensures:
- Engine start on ground (automatic and manual engine starts)
- Engine relight in flight
- Flameout prevention.

It consists of two identical independent circuits for each engine, normally controlled by the FADEC's channel A, with channel B on standby. Each FADEC channel can control both igniters.



IGNITION FOR STARTING

Ident.: DSC-70-80-20-00020605.0002001 / 28 MAY 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

ON GROUND

During a first automatic start attempt only one igniter is supplied. The FADEC automatically alternates the igniters and/or channels used in successive start sequences.
The ignition comes on automatically when N2 reaches 10 %.
The ignition is automatically cut off when N2 reaches 54 %.
If the automatic start fails the FADEC energizes both igniters at the same time during the second attempt at an engine start.
During a manual start both igniters are supplied, when the ENG MASTER lever is ON. Both igniters cut off when N2 reaches 54 %.

IN FLIGHT

In case of start attempt in flight, when the ENG MASTER lever is ON, both igniters are supplied.

IGNITION FOR STARTING

Ident.: DSC-70-80-20-00020605.0006001 / 28 MAY 20
Applicable to: LV-KHT, LV-KHU

ON GROUND

During a first automatic start attempt only one igniter is supplied. The FADEC automatically alternates the igniters used in successive start sequences.
When residual EGT is above 100 °C, the engine is cranked until the EGT goes below 100 °C.

Note: 1. *In the case of a second automatic start attempt after the failure of one igniter to light up, both igniters are supplied when the EGT goes below 150 °C.*
2. *In the case of an automatic restart attempt after an automatic start abort, the start sequence starts again from the beginning, and therefore only one igniter is supplied.*

During a manual start both igniters are supplied, when the ENG MASTER lever is ON.

IN FLIGHT

In case of start attempt in flight, when the ENG MASTER lever is ON, both igniters are supplied.

CONTINUOUS IGNITION

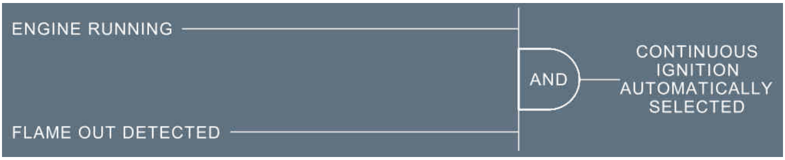
Ident.: DSC-70-80-20-00020606.0004001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Continuous ignition is either selected manually or automatically to protect engine combustion.

MANUAL SELECTION

In flight, continuous ignition is selected, when the ENG START selector is on IGN/START, provided the assigned engine is running.
On ground, after starting, since ignition is automatically cut off, to select continuous ignition, turn the ENG START selector to NORM, then back to IGN/START.

AUTOMATIC SELECTION



CONTINUOUS IGNITION

Ident.: DSC-70-80-20-00020606.0003001 / 09 FEB 18
Applicable to: LV-KHT, LV-KHU

Continuous ignition is either selected manually or automatically to protect engine combustion.

MANUAL SELECTION

In flight, continuous ignition is selected, when the ENG START selector is on IGN/START, provided the assigned engine is running.
Only one igniter is selected. If failed, both igniters are automatically selected.
On ground, after starting, since ignition is automatically cut off, to select continuous ignition, turn the ENG START selector to NORM, then back to IGN/START.

AUTOMATIC SELECTION

Continuous ignition (igniters A + B) is automatically selected:

- If engine anti-ice is selected on and relevant EIU/EIVMU is inoperative
- For 10 s, in the event of engine flame out condition detected by FADEC on ground or in flight (auto relight function)
- For 10 s in the event of inadvertent cycling of the Master lever with the engine running provided N3 is above 50 %.

WINDMILLING QUICK RELIGHT FUNCTION

Ident.: DSC-70-80-20-00020721.0003001 / 04 SEP 18
Applicable to: ALL

In case of inadvertent engine shutdown by cycling the Engine Master lever to OFF then ON, the FADEC will attempt automatically a relight regardless of the rotary selector position.

GENERAL

Ident.: DSC-70-80-30-00001175.0001001 / 21 MAR 16
Applicable to: ALL

The engine starting system consists of an air turbine starter and a start valve.
The start valve admits air supplied by the pneumatic system to operate the starter.
The FADEC electrically controls the start valve. On ground, in the event of an electrical control failure, the start valve can be manually operated by a handle.

AUTOMATIC STARTING

Ident.: DSC-70-80-30-00020722.0002001 / 10 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

This sequence is under the FADEC's full authority, which controls the:
- Start valve
- Igniter(s)
- Fuel HP valves.

It provides:
- Detection of hot start, hung start, stall or no light up, and protection for starter reengagement speed and time
- FAULT announcement with specific ECAM message
- Start abort on ground (high pressure valve closure, start valve closure, and ignition stopped), and automatic engine crank after start abort and control of any additional start attempts.

In flight, the FADEC identifies the windmilling or starter-assisted airstart conditions, according to engine parameters and the flight conditions.
This sequence may be interrupted by selection of the engine master lever to OFF.

AUTOMATIC STARTING

Ident.: DSC-70-80-30-00020722.0004001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

This sequence is under the FADEC's full authority, which controls the:
- Start valve
- Igniter(s)
- Fuel HP valves.

It provides:

- Detection of hot start, hung start, surge, no light up or N1 rotor locked
- FAULT announcement with specific ECAM message
- Start abort on ground (high pressure valve closure, start valve closure, ignition stopped) and automatic engine dry crank after start abort
  One further automatic start attempt will be initiated by the FADEC after cranking, except in the case of N1 rotor locked. If this start attempt fails, the start will be aborted.

In flight, the FADEC identifies the windmilling or starter-assisted airstart conditions, according to engine parameters and the flight conditions.
This sequence may be interrupted by selection of the engine master lever to OFF.
Automatic start abort is inhibited on ground, when N3 is above 50 % or in flight.

AUTOMATIC STARTING SEQUENCE

Applicable to: ALL

INITIAL CONFIGURATION OF THE CONTROLS

The initial configuration prior to an automatic engine start is the following:
- The ENG MASTER lever is set to OFF
- The ENG START selector is set to NORM
- The ENG MAN START pb-sw is set to OFF.

Ident.: DSC-70-80-30-A-00020624.0001001 / 28 MAY 20
Applicable to: ALL

FIRST STEP

The flight crew must set the ENG START selector to IGN/START, leading to the following:
- The ENG SD page appears on the SD
- All engine parameters are available
- All pack valves automatically close.

After 30 s, if the flight crew does not set the ENG MASTER lever to ON (*Refer to DSC-70-80-30 Second Step*), the pack valves automatically open again and in case of first engine start the ENG SD page will automatically disappear.

Ident.: DSC-70-80-30-A-00020625.0004001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

SECOND STEP

The flight crew must set the ENG MASTER lever to ON, and the following steps occur:
- The LP fuel valve opens
- The engine start valve opens (except in flight in the stabilized windmill zone)
- The ignition starts:
  - On ground: when N3 is between 25 and 30 %
  - In flight: Immediately.
- The HP fuel valve opens
- When N3 ≥ 50 %, the engine start valve closes (the valve is fully closed in 10 s)
- The ignition stops.

Ident.: DSC-70-80-30-A-00020625.0002001 / 10 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

SECOND STEP

The flight crew must set the ENG MASTER lever to ON, and the following steps occur:
- The LP fuel valve opens
- The engine start valve opens

- When N2 ≥ 10 %, the ignition starts
- When N2 ≥ 15 %, the HP fuel valve opens
- When N2 ≥ 50 %, the engine start valve closes
- When N2 ≥ 54 %, the ignition stops.

Ident.: DSC-70-80-30-A-00020626.0001001 / 21 MAR 17
Applicable to: ALL

THIRD STEP

The automatic engine start is finished.
The flight crew must set the ENG START selector to NORM.
On ground the WHEEL SD page replaces the ENG SD page.
In flight the CRUISE SD page replaces the ENG SD page.
If ENG START selector is not switched to NORM, the ENG page is automatically replaced by the WHEEL or CRUISE SD page 15 s after all engines are running.

Ident.: DSC-70-80-30-A-00020627.0001001 / 21 MAR 17
Applicable to: ALL

INTERRUPTION OF THE AUTOMATIC START

When required by ECAM and after confirmation, the flight crew must set the ENG MASTER lever to OFF.

If the flight crew sets the ENG MASTER lever to OFF, the FADEC automatically:
- Closes the LP and the HP fuel shutoff valves
- Stops to energize the ignitor
- Closes the engine start valve.

MANUAL STARTING

Ident.: DSC-70-80-30-00020738.0002001 / 10 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

If an automatic start is not successful, the flight crew can perform a manual start.
In the manual start sequence, the FADEC has limited control. As a result, the flight crew must monitor engine acceleration.

To perform a manual start, the flight crew must:
- Set the ENG START selector to IGN/START
- Set the ENG MAN START pb-sw to ON
- Set the ENG MASTER lever to ON.

The FADEC:

- Opens the engine start valve when the flight crew:
  - Sets the ENG START selector to IGN/START
  - Sets the ENG MAN START pb-sw to ON
- Opens the HP shutoff valve, and operates both igniters when the flight crew sets the ENG MASTER lever to ON
- Closes the engine start valve, and cuts off the ignition when N2 reaches 54 %.

For more information about the manual start sequence, *Refer to PRO-NOR-SUP-ENG Manual Engine Start - General*.
The FADEC provides a passive survey of the engine during the starting sequence.
On ground, it will automatically abort the starting sequence in the case of starter reengagement speed exceedance.
In flight, the FADEC always commands a starter assisted airstart.

MANUAL STARTING

Ident.: DSC-70-80-30-00020738.0004001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

If an automatic start is not successful, the flight crew can perform a manual start.
In the manual start sequence, the FADEC has limited control. As a result, the flight crew must monitor engine acceleration.

To perform a manual start, the flight crew must:

- Set the ENG START selector to IGN/START
- Set the ENG MAN START pb-sw to ON
- Set the ENG MASTER lever to ON.

The FADEC:

- Opens the engine start valve when the flight crew:
  - Sets the ENG START selector to IGN/START
  - Sets the ENG MAN START pb-sw to ON
- Opens the HP shutoff valve, and operates both igniters when the flight crew sets the ENG MASTER lever to ON
- Closes the engine start valve, and cuts off the ignition when N3 reaches 50 %.

For more information about the manual start sequence, *Refer to PRO-NOR-SUP-ENG Manual Engine Start - General*.
The FADEC provides a passive survey of the engine during the starting sequence.

In flight, the FADEC always commands a starter assisted airstart unless the N3 is above the start valve closure value (50 % N3).

ENGINE VENTILATION (DRY CRANKING)

Ident.: DSC-70-80-30-00020737.0002001 / 28 MAY 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

A dry cranking cycle enables the engine to be ventilated to remove fuel vapors after an unsuccessful start attempt on the ground.
Cranking can be manually selected by setting the ENG START selector to CRANK and the MAN START pb to ON (ENG MASTER lever OFF). It is stopped by setting the MAN START pb to OFF.

CAUTION	Selecting the ENG START selector to NORM would not stop the cranking.

ENGINE VENTILATION (DRY CRANKING)

Ident.: DSC-70-80-30-00020737.0003001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

A dry cranking cycle enables the engine to be ventilated to remove fuel vapors after an unsuccessful start attempt on ground.
Cranking can be manually selected by setting the ENG START selector to CRANK and the ENG MAN START pb-sw to ON (ENG MASTER lever to OFF). It is stopped by setting the ENG MAN START pb-sw to OFF or selecting the ENG START selector to NORM.
A manual start sequence can be initiated immediately following a dry crank sequence by selecting the ENG START selector to IGN/START and ENG MASTER lever to ON.

Intentionally left blank

ALTERNATE START/IGNITION INFORMATION

Ident.: DSC-70-80-40-00020630.0001001 / 10 MAY 21
Applicable to: ALL

In the case of EIVMU/EIU failure, the FADEC uses a backup signal from the ENG MASTER lever and the alternate start/ignition signal to control:

- An automatic start, or
- A dry crank, or
- Continuous ignition.

Manual starting is no longer available.

ENG START SELECTOR

NORM : Normal mode of operation.

IGN/START : Use the IGN/START position to:

- Initiate the automatic or manual start sequences of the associated engine, when the ENG MASTER lever is set to OFF, or
- Initiate the ignitors in flight as required.

L13

CRANK : Use the CRANK position to:

- Initiate the dry crank process of the associated engine, when the ENG MASTER lever is set to OFF and the ENG MAN START pb-sw is set to ON.
- Initiate the wet crank process of the associated engine for maintenance purposes, when the ENG MASTER lever, and the ENG MAN START pb-sw are set to ON.

Ident.: DSC-70-90-20-30-00019019.0001001 / 28 MAY 20

ENG MASTER LEVER

L13

The FADEC:

- Provides the associated engine with continuous ignition, when both engines are running and the ENG START selector is set to IGN/START, or
- Initiates the wet crank process of the associated engine for maintenance purpose, when the ENG START selector is set to CRANK and the ENG MAN START pb-sw is set to ON, or
- Initiates the automatic start sequence of the associated engine, when the ENG START selector is set to IGN/START, or
- Initiates the manual start sequence of the associated engine, when the ENG START selector is set to IGN/START and the ENG MAN START pb-sw is set to ON.

The FADEC:

- Shuts down the associated engine, or
- Aborts the start sequence of the associated engine.

Ident.: DSC-70-90-20-30-00019020.0001001 / 21 MAR 16

ENG MASTER LIGHT

FIRE light : A fire is detected in the corresponding engine.

FAULT light :
- The position of the HP fuel shutoff valve is abnormal, or
- The automatic start sequence of the associated engine aborts, or
- There is a malfunction of the thrust control.

THRUST LEVERS

THRUST LEVERS

The flight crew uses the thrust levers in order to:
- Adjust the thrust, or
- Select a thrust stop or detent.

The flight crew can move each thrust lever individually.

L2 The position of the thrust levers appears on the E/WD, via a blue circle on the thrust gauge.

L1 The flight crew can move each thrust lever forward the Idle (0) stop, when the associated thrust reverser lever is set to the stowed detent.

Ident.: DSC-70-90-20-40-00019023.0001001 / 21 MAR 16

THRUST DETENTS AND STOPS

There are one stop and three detents, for the thrust levers:
- The Idle (0) stop
- The Climb (CL) detent
- The Maximum Continuous Thrust (MCT)/Flexible Take Off (FLX) detent
- The Takeoff (TO)/Go-Around (GA) detent.

There are two stops and one detent, for the thrust reverser levers:
- The stowed stop
- The idle reverser (IDLE REV) detent
- The maximum reverser (MAX REV) stop.

Ident.: DSC-70-90-20-40-00019024.0001001 / 21 MAR 16

THRUST REVERSER LEVERS

The flight crew uses the thrust reverser levers in order to:
- Control the deployment and the stowage of the associated reversers
- Adjust the associated reverse thrust.

The flight crew can move the thrust reverser lever backward the stowed detent (to the IDLE REV detent or MAX REV stop), when the associated thrust lever is set to the Idle (0) stop.

Ident.: DSC-70-90-20-40-00019025.0001001 / 18 MAY 22

A/THR INSTINCTIVE DISCONNECT pb

Pressing the A/THR INSTINCTIVE DISCONNECT pb disconnects the A/THR.

L2 For more information about the A/THR INSTINCTIVE DISCONNECT pb, *Refer to DSC-22_30-50-40 A/THR Disconnection*.

THRUST RATING MODE AND THRUST LIMIT VALUE

Indicates the thrust limit value and the associated thrust rating mode based on:

- The position of the thrust levers,
- Aircraft on ground or in flight,
- The engine status, i.e. running or not running,
- The data entered in the T.O and CLB panels of the FMS ACTIVE/PERF page.

Ident.: DSC-70-90-40-50-00018747.0003001 / 21 MAR 16

THRUST RATING MODE

The thrust rating modes are:

TOGA	:	Takeoff or go-around (TOGA) thrust rating mode is selected.
MCT	:	Maximum Continuous Thrust (MCT) rating mode is selected.
CLB	:	Climb (CLB) thrust rating mode is selected.
FLX	:	Flexible (FLX) takeoff thrust rating mode is selected.

DCLB1(2) : Derated Climb ◁ (DCLB) thrust rating mode is selected.
There are 2 levels of derated climb: DCLB1 and DCLB2.

D04 : Derated Takeoff ◁ thrust rating mode is selected.
There are several levels of derated takeoff: D04, D08, D12, D16, D20, ...

GA SOFT : Soft go-around ◁ thrust rating mode is selected.

XX in amber : There is no thrust rating mode selected, the selected rating mode is not available, or at least one engine operates in degraded N1 mode on ground.

L2 The thrust rating mode disappears when the thrust reversers are selected.

Ident.: DSC-70-90-40-50-00018750.0001001 / 12 JUL 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

THRUST RATING MODE

The thrust rating modes are:

TOGA : Takeoff or go-around (TOGA) thrust rating mode is selected.

MCT : Maximum Continuous Thrust (MCT) rating mode is selected.

CLB : Climb (CLB) thrust rating mode is selected.

FLX : Flexible (FLX) takeoff thrust rating mode is selected.

DCLB1(2) : Derated Climb ◁ (DCLB) thrust rating mode is selected.
There are 2 levels of derated climb: DCLB1 and DCLB2.

D04 : Derated Takeoff ◁ thrust rating mode is selected.
There are several levels of derated takeoff: D04, D08, D12, D16, D20, ...

GA SOFT : Soft go-around ◁ thrust rating mode is selected.

L2 The thrust rating mode disappears when the thrust reversers are selected.

Ident.: DSC-70-90-40-50-00018756.0003001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

THRUST LIMIT VALUE

EPR value : Indicates the EPR limit value associated with the thrust rating mode, when at least one engine operates in EPR mode.

L12

N1 value : Indicates the N1 limit value associated with the thrust rating mode, when all engines operate in rated N1 mode.
The N1 MODE indication appears.

XX in amber : Indicates that the thrust limit value is not available, or that at least one engine operates in degraded N1 mode on ground.

L2 The thrust limit value disappears when the thrust reversers are selected.

Ident.: DSC-70-90-40-50-00018756.0001001 / 28 FEB 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

THRUST LIMIT VALUE

N1 value : Indicates the N1 limit value associated with the thrust rating mode.

L2 The thrust limit value disappears when the thrust reversers are selected.

Ident.: DSC-70-90-40-50-00018761.0001001 / 21 MAR 16
Applicable to: ALL

FLEX TEMPERATURE

Cyan : Indicates the flexible temperature that the flight crew entered in the T.O panel of the FMS PERF page, when the FLX rating mode is selected.

Ident.: DSC-70-90-40-50-00018763.0001001 / 21 MAR 16
Applicable to: ALL

IDLE INDICATION

Both engines are at idle speed, and the aircraft is in flight.

L2 Pulses during 10 s, and then remains steady.

Ident.: DSC-70-90-40-50-00018765.0001001 / 21 MAR 16
Applicable to: ALL

AVAIL INDICATION

The engine is started, and at or above idle.

L2 On ground, appears steady during 10 s after a successful start.
In flight, pulses during 1 min after a successful relight.
The AVAIL indication disappears when the flight crew moves the thrust lever forward the idle detent.

Ident.: DSC-70-90-40-50-00018766.0001001 / 21 MAR 16
Applicable to: ALL

REV INDICATION

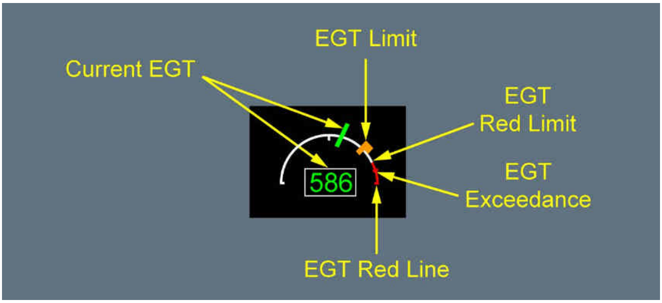
REV in green : On ground, the thrust reverser system is fully deployed.

L12

REV in amber : The thrust reverser system is unlocked.
In flight, the REV indication pulses during 9 s and then remains steady.

Ident.: DSC-70-90-40-50-00018769.0001001 / 21 MAR 16
Applicable to: ALL

EGT INDICATOR



Ident.: DSC-70-90-40-50-00018771.0003001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

CURRENT EGT

L12

Green	:	The current EGT is in normal range. The scale goes from 0 °C to 1 200 °C.
Amber	:	The current EGT exceeds the EGT limit.

L12

Red	:	The EGT is above the EGT red limit. The current EGT: - Is between 900 °C and 920 °C for more than 20 s, or - Exceeds 920 °C.

Ident.: DSC-70-90-40-50-00018771.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

CURRENT EGT

L12

Green	:	The current EGT is in normal range. The scale goes from 0 °C to 1 200 °C.
Amber	:	The current EGT exceeds the EGT limit.
Red	:	The EGT is above the EGT red limit.

Ident.: DSC-70-90-40-50-00018773.0003001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

EGT LIMIT

The amber line indicates the maximum EGT (i.e. the EGT limit).

L2 The maximum EGT is:
- 700 °C, during the engine start sequence on ground, or
- 900 °C, in all other cases.

The EGT limit does not appear:
- When a takeoff or a go-around mode is selected, or
- When the thrust reversers are selected, or
- If the alpha floor protection is activated.

Ident.: DSC-70-90-40-50-00018773.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

EGT LIMIT

The amber line indicates the maximum EGT (i.e. the EGT limit).

L2 The maximum EGT is:
- 750 °C, during the engine start sequence on ground, or
- 940 °C, in all other cases.

The EGT limit does not appear:
- When a takeoff or a go-around mode is selected, or
- When the thrust reversers are selected, or
- If the alpha floor protection is activated.

Ident.: DSC-70-90-40-50-00018775.0001001 / 21 MAR 16
Applicable to: ALL

EGT EXCEEDANCE

The EGT exceedance is the highest value that the EGT reached.
The EGT exceedance appears when:

- The current EGT exceeds the EGT red limit, or
- The EGT exceeded the EGT red limit.

L2 The red mark no longer appears at the next engine start sequence on ground, or after a maintenance action.

Ident.: DSC-70-90-40-50-00018776.0003001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

EGT RED LINE

The EGT red line appears between the EGT red limit and the end of the scale.
L2 The EGT red limit is 920 °C.

Ident.: DSC-70-90-40-50-00018776.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

EGT RED LINE

The EGT red line appears between the EGT red limit and the end of the scale.
L2 The EGT red limit is 975 °C.

Ident.: DSC-70-90-40-50-00018783.0002001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

Applicable to: LV-KHT, LV-KHU

THRUST LEVER POSITION

The blue circle indicates the position of the thrust lever, when the engine operates in N1 mode.
In manual mode, the blue circle corresponds to the N1 value reached after the stabilization of the engine parameters.
L2 The thrust lever position disappears when the thrust reversers are selected.

Ident.: DSC-70-90-40-50-00018799.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

THRUST LEVER POSITION

The blue circle indicates the position of the thrust lever.
In manual mode, the blue circle corresponds to the N1 value reached after the stabilization of the engine parameters.

Ident.: DSC-70-90-40-50-00018800.0003001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

N1 LIMIT

The amber mark indicates the N1 limit.
L2 This corresponds to the maximum N1 value:

- When the thrust levers are in TO/GA detent and the engine operates in rated N1 mode, or
- When the thrust levers are in MAX REV position.

Ident.: DSC-70-90-40-50-00018800.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

N1 LIMIT

The amber mark indicates the N1 limit.

L2 This corresponds to the maximum N1 value when the thrust levers are in TO/GA detent or in the MAX REV position.

Ident.: DSC-70-90-40-50-00018802.0001001 / 21 MAR 16
Applicable to: ALL

N1 EXCEEDANCE

The N1 exceedance is the highest value that the N1 reached.
The N1 exceedance appears when the current N1 exceeds the N1 red limit.
The N1 exceedance remains even if the N1 value decreases below the N1 red limit.

L2 The red mark no longer appears at the next engine start sequence on ground, or after a maintenance action.

Ident.: DSC-70-90-40-50-00018804.0002001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

N1 RED LINE

The N1 red line appears between the N1 red limit and the end of the scale.

L2 The N1 red limit is 99 %.

Ident.: DSC-70-90-40-50-00018804.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

N1 RED LINE

The N1 red line appears between the N1 red limit and the end of the scale.

L2 The N1 red limit is 115.5 %.

Ident.: DSC-70-90-40-50-00018805.0002001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

N2

In a grey box : The engine start sequence or the crank process is in progress.
Green : N2 is in normal range.

L12

Red : N2 exceeds the N2 red limit.
N2 red limit is 113 %.
A red cross appears.
The red cross no longer appears at the next engine start sequence on ground, or after a maintenance action.

L12

Dashes : The accuracy of the N2 measurement is degraded.
Two amber dashes appear over the last digit.

Ident.: DSC-70-90-40-50-00018824.0003001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

N3

In a grey box : The engine start sequence or the crank process is in progress.

Green : N3 is in normal range.

L12

Red : N3 exceeds the N3 red limit.
N3 red limit is 100 %.
A red cross appears.
The red cross no longer appears at the next engine start sequence on ground, or after a maintenance action.

L12

Dashes : The accuracy of the N3 measurement is degraded.
Two amber dashes appear over the last digit.

N2

Green : N2 is in normal range.

L12

Red : N2 exceeds the N2 red limit.
N2 red limit is 103.3 %.
A red cross appears.
The red cross no longer appears at the next engine start sequence on ground, or after a maintenance action.

L12

Dashed : The accuracy of the N2 measurement is degraded.
Two amber dashes appear over the last digit.

Ident.: DSC-70-90-40-60-00018852.0001001 / 21 MAR 16
Applicable to: ALL

FUEL USED INDICATION

L12

Green : Indicates the fuel used by each engine.
This value automatically resets on ground, at the next engine start.
Appears in multiples of 10 kg (20 lb).

L12

Dashed : The value accuracy is degraded.
Two amber dashes appear over all five digits.
This occurs when the Fuel Flow is not valid in flight, for more than 1 min.

Ident.: DSC-70-90-40-60-00018853.0001001 / 21 MAR 16
Applicable to: ALL

FUEL FILTER CLOG INDICATION

Indicates that the pressure loss across the fuel filter is excessive.

Ident.: DSC-70-90-40-60-00018854.0006001 / 31 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

OIL QUANTITY

L12

Green : The oil quantity is in normal range.
The scale goes from 0 to 30 QT.

L12

Pulses green : The needle and the oil quantity value pulse green.
The advisory limit is 2.5 QT.

Ident.: DSC-70-90-40-60-00018854.0004001 / 12 JUL 18
Applicable to: LV-KHT, LV-KHU

OIL QUANTITY

L12

Green	The oil quantity is in normal range. The scale goes from 0 to 22 QT.
Pulses green	The needle and the oil quantity value pulse green. The advisory limit is 4 QT.

L12

Ident.: DSC-70-90-40-60-00018855.0004001 / 12 JUL 18
Applicable to: LV-KHT, LV-KHU

OIL PRESSURE

L12

Green	The oil pressure is in normal range. The scale goes from 0 to 250 PSI.
Red	The oil pressure is in the red range. The red range is between 0 and 25 PSI.

L12

Ident.: DSC-70-90-40-60-00018855.0002001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

OIL PRESSURE

L12

Green	The oil pressure is in normal range. The scale goes from 0 to 100 PSI.
Red	The oil pressure is in the red range. The red range is between 0 and 10 PSI.

L12

Ident.: DSC-70-90-40-60-00018856.0004001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

OIL TEMPERATURE

Green	The oil temperature is in normal range.
Amber	The oil temperature is above 190 °C.

Ident.: DSC-70-90-40-60-00018856.0002001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

OIL TEMPERATURE

Green	The oil temperature is in normal range.

Pulses green	:	The oil temperature is above 160 °C for less than 15 min.
Amber/red	:	The oil temperature is above 160 °C for more than 15 min, or above 175 °C.

Ident.: DSC-70-90-40-60-00018857.0001001 / 21 MAR 16
Applicable to: ALL

OIL FILTER CLOG INDICATION

Indicates that the pressure loss across the oil filter is excessive.

Ident.: DSC-70-90-40-60-00018858.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

N1, N2 VIBRATIONS

Green	:	The vibration of the LP (HP) rotor is in normal range.
Pulses green	:	The level of LP (HP) rotor vibration is excessive.

Ident.: DSC-70-90-40-60-00018859.0001001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

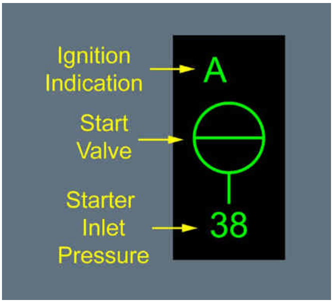
N1, N2, N3 VIBRATIONS

Green	:	The vibration of the LP (IP) (HP) rotor is in normal range.
Pulses green	:	The level of LP (IP) (HP) rotor vibration is excessive.

Ident.: DSC-70-90-40-60-00018860.0001001 / 21 MAR 16
Applicable to: ALL

STARTING SEQUENCE INDICATION

During the engine start sequence, the starting sequence indication appears on the ENG SD page.



Ident.: DSC-70-90-40-60-00018861.0001001 / 21 MAR 16
Applicable to: ALL

IGNITION INDICATION

A	:	The igniter A(B) is used for the engine start sequence.
A B	:	Both igniters A and B are used for the engine start sequence or continuous ignition.

Ident.: DSC-70-90-40-60-00018862.0001001 / 21 MAR 16
Applicable to: ALL

START VALVE

	:	The engine start valve is fully closed.
	:	The engine start valve is fully open.
	:	The engine start valve failed in the closed position.
	:	The engine start valve failed in the open position.

Ident.: DSC-70-90-40-60-00018864.0004001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

STARTER INLET PRESSURE

Green	:	The starter inlet pressure is normal.
Amber	:	The starter inlet pressure is either: - Abnormally high, or - Abnormally low (below 15 PSI, when N3 is above 8 % and the starter valve is not closed).

Ident.: DSC-70-90-40-60-00018864.0001001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

STARTER INLET PRESSURE

Green	:	The starter inlet pressure is normal.
Amber	:	The starter inlet pressure is either: - Abnormally high, or - Abnormally low (below 21 PSI, when N2 is above 10 % and the starter valve is not closed).

Ident.: DSC-70-90-40-60-00018866.0002001 / 21 MAR 16
Applicable to: ALL

NACELLE TEMPERATURE INDICATION

L12

Green	:	The nacelle temperature is normal.
Pulses green	:	The nacelle temperature goes above the advisory limit, that correspond to the white dash. The advisory limit is 260 °C.

Intentionally left blank

ERRONEOUS ENGINE FUEL LEAK DETECTION

Ident.: DSC-70-100-00024301.0004001 / 28 MAY 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-KAN, LV-KAO

DESCRIPTION

A spurious display of the ENG 1(2) FUEL LEAK alert may occur on an engine that is not affected by a fuel leak.
One of the triggering conditions of the ENG 1(2) FUEL LEAK alert is a comparison between the fuel flows on both engines. A misbehaviour of an engine may cause the fuel flow of this engine to decrease. In this case, if both thrust levers are in the same position, the FWC may erroneously consider that a fuel leak affects the engine that has the highest fuel flow.
The ENG 1(2) FUEL LEAK alert requires the flight crew to shutdown the affected engine, if they confirm the fuel leak.
For more information about the fuel leak detection, *Refer to PRO-ABN-FUEL [QRH] FUEL LEAK*.

OPERATIONAL RECOMMENDATION

Before the flight crew considers an engine shutdown, they should check engine and fuel parameters on both engines (e.g. N1, FOB, FU, fuel flow, fuel distribution, fuel imbalance) in order to confirm the leak.
For more information about the fuel leak, *Refer to FCTM/PR-AEP-FUEL Fuel Leak*.

M (1)	**Localization**	**DU Title**	**DU identification**	**DU date**

Reason for issue:

When in the AUTO position, the MultiScan AUTO mode adjusts the tilt according to the altitude of the aircraft.
In cruise, MULTISCAN function provides a large view of the weather ahead, ie display of weather cells located on and below aircraft path.
At low altitudes (below FL200), the tilt is adjusted upward to manage clutter from strong ground targets. In some cases, the weather may be low-lying and therefore may be below the radar beam and not be displayed until the aircraft descends closer to the precipitation level.
Therefore, this Temporary Revision is issued to indicate that, when the Multiscan is in the AUTO position, the GAIN should be manually set to +4 when the aircraft is below FL200.

In addition, the flight crew should temporarily set the MULTISCAN switch to MAN, if:

- *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt until displaying ground echoes.*
- *The weather display is ambiguous or unexpected, in order to better analyze the weather situation using manual tilt according to standard technique.*
- *In particular below FL200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to Manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display.*

In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and Manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.

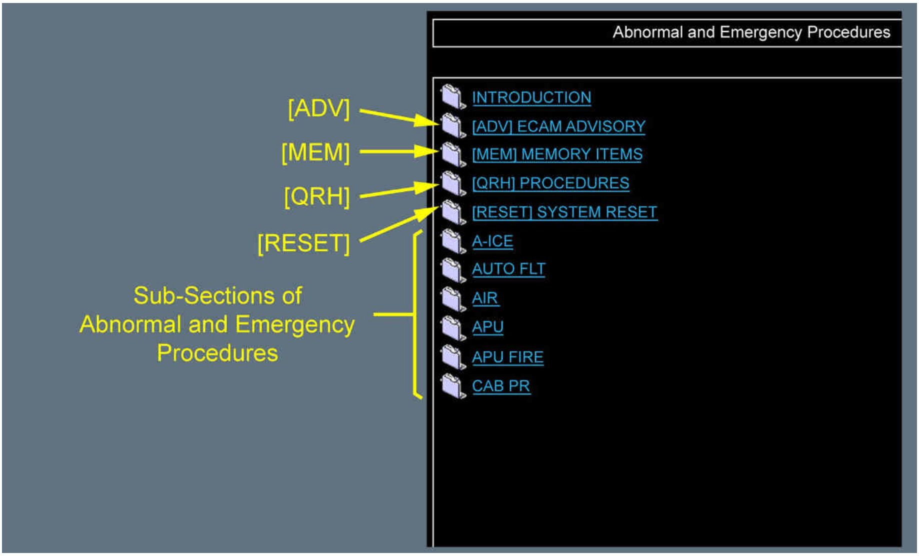
CONTENT

Ident.: PRO-ABN-ABN-00-00020762.0001001 / 09 NOV 20
Applicable to: ALL

Abnormal and Emergency procedures involve actions that the flight crew must perform to ensure the overall safety of the flight, and adequate workload.

L2 For more information about the management of abnormal operations, *Refer to FCTM/AOP-30-10 Introduction*.

Abnormal and Emergency Procedure Overview



Abnormal and Emergency Procedures
[ADV]
[MEM]
[QRH]
[RESET]
Sub-Sections of Abnormal and Emergency Procedures
INTRODUCTION
[ADV] ECAM ADVISORY
[MEM] MEMORY ITEMS
[QRH] PROCEDURES
[RESET] SYSTEM RESET

AIR
APU
APU FIRE
CAB PR

L1 [ADV] ECAM ADVISORY

The [ADV] ECAM ADVISORY section provides direct access to the list of all advisories that can be displayed on the ECAM SD pages. The [ADV] section is also available in the QRH.

L2 For more information, *Refer to [ADV] ECAM Advisory*.

L1 Advisories are system parameters that start to deviate from their usual operational range. However, an advisory does not require flight crew actions, except monitoring.

L2 For more information about Advisory function, *Refer to DSC-31-20 System Pages*.

L1 [MEM] MEMORY ITEMS

The [MEM] MEMORY ITEMS menu provides direct access to the list of memory items.

L2 For more information, *Refer to [MEM] Memory Items*.

L1 The content of the memory items are described in the applicable sub-sections of the abnormal and emergency procedures.
Memory items are procedures of an ECAM or QRH procedure that the flight crew must apply by memory to ensure a safe flight path. In some time-critical situations, the flight crew has no time to refer to the ECAM and/or to the QRH.

L2 For more information, *Refer to FCTM/AOP-10-40 Abnormal and Emergency Procedures*.

L1 [QRH] PROCEDURES

The [QRH] PROCEDURES menu provides direct access to the list of all the FCOM abnormal and emergency procedures that are also in the QRH.

L2 For more information, *Refer to [QRH] Procedures*.

L1 The content of the QRH procedures are described in the applicable sub-sections of the abnormal and emergency procedures.

Note: *Only the FCOM version of a procedure provides layer 2 and 3 information for consultation purpose.*

[RESET] SYSTEM RESET

The [RESET] SYSTEM RESET section provides direct access to the table listing all the system resets that are permitted, and the condition to apply them. The [RESET] section is also available in the QRH.

L2 For direct access to the table, *Refer to [RESET] System Reset*.

L1 SUB-SECTIONS OF ABNORMAL AND EMERGENCY PROCEDURES

This part of the FCOM describes the detailed content of all abnormal and emergency procedures. All procedures are grouped in sub-sections that can be system related (e.g. AIR, FUEL, etc.) or non-system related (e.g. MISC, T.O, CONFIG, etc.).
The sub-sections are sorted by alphabetic order.
For each sub-section, procedures are listed in the following order:

1. The memory items
   The title of the memory items starts with the [MEM] prefix
2. The abnormal and emergency procedures of the QRH
   The title of these procedures starts with the [QRH] prefix
3. The ECAM procedures.

PROCEDURE LAYOUT

Applicable to: ALL

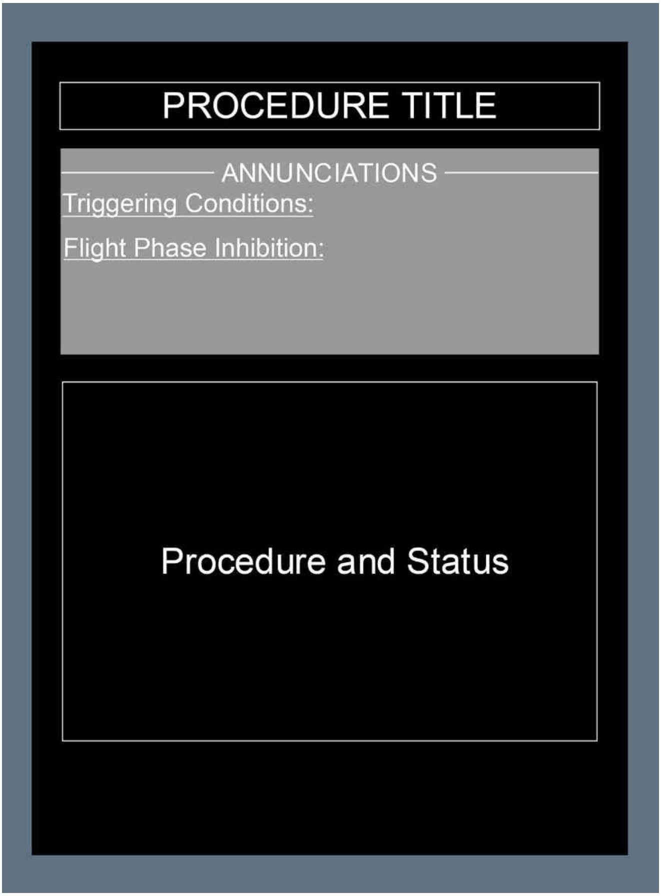
Ident.: PRO-ABN-ABN-00-A-00020763.0001001 / 17 MAR 17

GENERAL

The presentation of procedures is, as far as practicable, identical to the way it is displayed on the ECAM. The abbreviations are identical to those used on the cockpit panels.
All actions and information displayed on ECAM are provided in large letters. Other information, not on ECAM, is provided in small letters.
Expanded information is as far as practicable provided in layer 2. This information:

- Identifies the particular failures
- Explains actions for which the reason is not self-evident
- Provides some background on the reasons and /or the effects of a given action.

FCOM presentation of ABN or EMER procedures



PROCEDURE TITLE
ANNUNCIATIONS
Triggering Conditions:
Flight Phase Inhibition:
Procedure and Status

Ident.: PRO-ABN-ABN-00-A-00020772.0001001 / 17 MAR 17

PROCEDURE TITLE

The title of an abnormal or emergency procedure, displayed on the ECAM, appears on white background.
Abnormal procedure displayed on ECAM (amber caution) :

CAB PR SAFETY VALVE OPEN

Emergency procedure displayed on ECAM (red warning) :

🟥 CAB PR EXCESS CAB ALT 🟥

The title of an abnormal or emergency procedure, that does not appear on the ECAM, is on a grey background.
Abnormal procedure not displayed on ECAM :

[QRH] L/G GRAVITY EXTENSION

Emergency procedure not displayed on ECAM :

🟥 [QRH] DITCHING 🟥

SEVERAL ALERTS UNDER THE SAME TITLE

When applicable, several alerts may be grouped under the same procedure title.

Note: *Alerts that have the same procedure title may be differentiated by a subtitle (e.g. ENG FIRE (On Ground) versus ENG FIRE (In Flight))*

Ident.: PRO-ABN-ABN-00-A-00020773.0001001 / 17 MAR 17

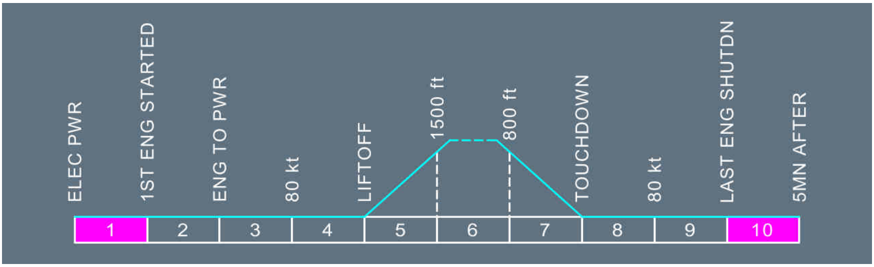
ANNUNCIATIONS

When applicable, the annunciations section provides:

- The triggering conditions, that describe the cause of the alert activation
- The flight phase inhibition.

FLIGHT PHASE INHIBITION

The Flight Phase Inhibition section indicates the flight phases during which the alert is inhibited. In the below example, the alert is inhibited in flight phase 1, and 10.



L2 For more information, Refer to DSC-31-15 ECAM Flight Phases.

Ident.: PRO-ABN-ABN-00-A-00020775.0001001 / 09 NOV 21

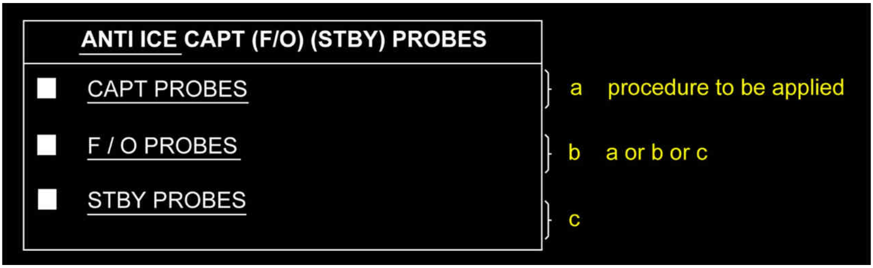
PROCEDURE AND STATUS

The Procedure and Status section provides the procedure and the Status (including approach procedure, limitations, inoperative systems, etc.), with additional information when relevant.

CONDITIONS

BLACK SQUARE

When several procedures appear under the same title, a black square marks the starting point of each procedure.
For example:



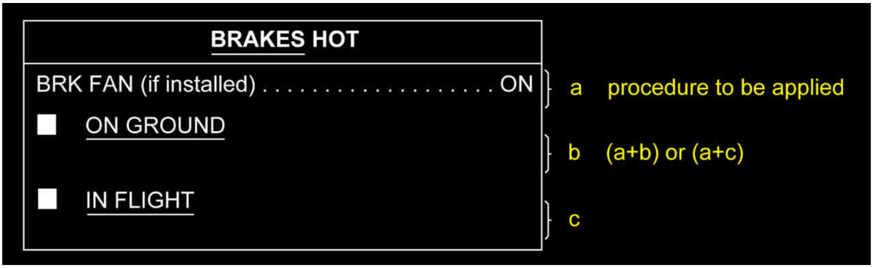
ANTI ICE CAPT (F/O) (STBY) PROBES

■ CAPT PROBES

■ F / O PROBES

■ STBY PROBES

Black squares also indicate parts of a procedure among which only one is applicable.
For example:



BRAKES HOT

BRK FAN (if installed) . . . . ON

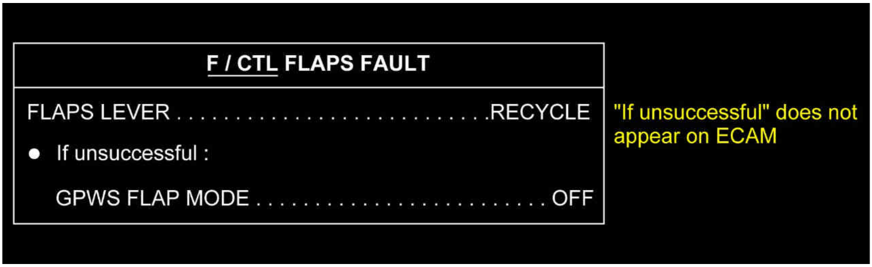
■ ON GROUND

■ IN FLIGHT

The ECAM does not display black squares.

BLACK DOT

If an action depends on a precondition, a black dot identifies the precondition. If the precondition appears on ECAM, it appears in LARGE LETTERS. If not, it appears in small letters.
For example:



F / CTL FLAPS FAULT

FLAPS LEVER . . . . .RECYCLE

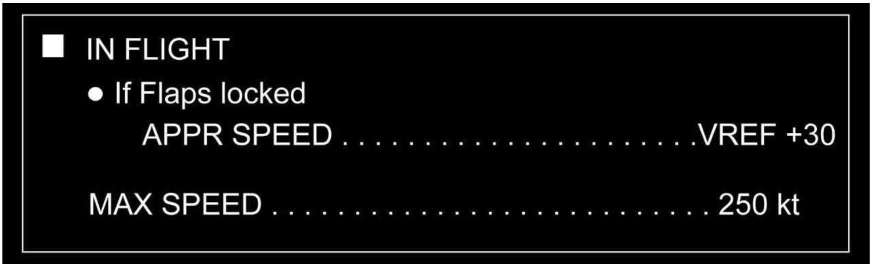
- If unsuccessful :

  GPWS FLAP MODE . . . . OFF

"If unsuccessful" does not appear on ECAM

INDENTATION

Indentation is used in order to identify when an action depends on a precondition/flight phase/procedure.
For example:



■ IN FLIGHT

- If Flaps locked

  APPR SPEED . . . . .VREF +30

MAX SPEED . . . . 250 kt

- The APPR SPEED is equal to VREF +30 kt only if the flaps are locked, because "APPR SPEED......VREF +30" is indented below "• If flaps locked".
- The MAX SPEED of 250 kt does not depend on the flaps locked condition because it is aligned with "• If Flaps locked". Therefore, MAX SPEED has to be respected whether the flaps are locked or not.

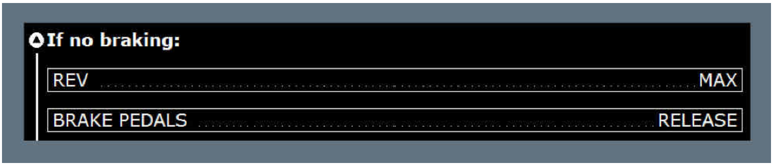
BOXED ITEMS

Items surrounded by a box enable the flight crew to easily identify them, as Memory items, OEB immediate actions or items introduced by “At ANY TIME of the procedure”.

MEMORY ITEMS

Memory items are items that the flight crew must memorize, in order to be able to rapidly apply them, without referring to the ECAM, and/or to the QRH.

Memory items



If no braking:

REV .... MAX

BRAKE PEDALS .... RELEASE

ABNORMAL AND EMERGENCY CALLOUTS

Applicable to: ALL

Ident.: PRO-ABN-ABN-00-B-00011839.0001001 / 23 DEC 14

ECAM PROCEDURES

1. "ECAM ACTION" is commanded by PF when required.
2. "CLEAR __ (title of the system) ?" is asked by the PM for confirmation by the PF, that all actions have been taken/reviewed on the present ECAM WARNING/CAUTION or SYSTEM PAGE. e.g.: "CLEAR HYDRAULIC ?" For the status; "REMOVE STATUS ?" will be used.
3. "CLEAR __ (title of the system)" is the command by the PF that the action and review is confirmed. For status page; "REMOVE STATUS" will be used.
4. "ECAM ACTIONS COMPLETE" is the announcement by the PM that all APPLICABLE ACTIONS have been completed.
5. Should the PF require an action from the PM during ECAM procedures, the order "STOP ECAM" will be used. When ready to resume the ECAM the order "CONTINUE ECAM" will be used.

Ident.: PRO-ABN-ABN-00-B-00019947.0001001 / 16 JAN 18

Some abnormal/emergency procedures require flight and cabin crews to use specific phraseology when communicating with each other. To ensure effective communication between the flight and cabin crews, the standard phraseology may be recalled at the preflight phase.

FROM	TO	PHRASEOLOGY	REMARKS
cockpit	cabin	Passenger Address (PA) System: "PURSER TO COCKPIT, PLEASE!"	The Purser, or any other cabin crewmember, must go to the cockpit
cockpit	cabin	Passenger Address (PA) System: "ATTENTION CREW! AT STATIONS!"	An emergency evacuation may soon be required
cockpit	cabin	Passenger Address (PA) System: "CABIN CREW and PASSENGERS REMAIN SEATED!"	The Captain decides that an evacuation is not required

Continued on the following page

Continued from the previous page

cockpit	cabin	Passenger Address (PA) System: "EVACUATE, EVACUATE"	The Captain orders an immediate evacuation
cabin	cockpit	Interphone: "PRIO CAPT"	Any cabin crewmember can make such a call. The flight crew must reply

Ident.: PRO-ABN-ABN-00-B-00011840.0001001 / 24 NOV 23

MEMORY ITEMS

The aim of the following callouts is to announce the appropriate procedure by calling out, in most cases, the title of the procedure. This allows the flight crew to be aware of the situation and be prepared to properly react (crew coordination, tasksharing and communication).

GPWS

As soon as avoidance maneuver is envisaged.
“PULL UP TOGA”

REACTIVE WINDSHEAR WARNING

”WINDSHEAR TOGA”

UNRELIABLE SPEED INDICATION

”UNRELIABLE SPEED”

TCAS

- **For aircraft equipped with AP/FD TCAS ◁ function:**

  As soon as a TA is triggered:
  - If the AP/FD TCAS mode is armed: "TCAS blue"
  - If the AP/FD TCAS mode does not arm: "TCAS, I have control"

- **For aircraft not equipped with AP/FD TCAS ◁ function:**

  As soon as a TA is triggered: "TCAS, I have control".

EMERGENCY DESCENT

”EMERGENCY DESCENT”

LOSS OF BRAKING

"LOSS OF BRAKING"

STALL RECOVERY

As soon as any stall indication is recognized:
"STALL, I have control"

STALL WARNING AT LIFT-OFF

"STALL, TOGA 15°"

MALFUNCTION BEFORE V1 AT TAKEOFF

EVENT	CAPT	F/O
If GO decision	GO	
If RTO decision	STOP	
- REV on EWD		REVERSE GREEN (1)
- Deceleration		DECEL (2)
- Autobrake disengagement	MANUAL BRAKING (3)	AUTOBRAKE OFF (4)

(1) *If the reverse deployment is not as expected, call "NO REVERSE ENGINE__" or "NO REVERSE", as appropriate.*

(2) *In the case of failure or no positive deceleration, call "NO DECEL".*

The "DECEL" callout means that the deceleration is felt by the flight crew and confirmed by:
- *The speed trend on the PFD, or*
- *The DECEL ◁ indication on the PFD, if the autobrake is active.*

The DECEL ◁ indication appears when the current deceleration reaches 80 % of the selected rate. However, the DECEL ◁ indication does not indicate the correct operation of the autobrake, but it only indicates that the selected deceleration rate is reached. For example, the DECEL ◁ indication may not appear on a contaminated runway, because of the anti-skid effect, even if the autobrake is active.

(3) *CAPT announces MANUAL BRAKING if:*
- *CAPT uses the brake pedals, and*
- *No AUTOBRAKE OFF callout from the F/O.*

(4) *F/O announces AUTOBRAKE OFF if:*
- *A/BRK does not engage as expected or A/BRK disengages, and*
- *No MANUAL BRAKING callout from the CAPT.*

SYST	CONDITIONS	RECOMMENDED ACTION
ENG	OIL TEMP 160 °C < T < 175 °C for 15 min	An increase in oil temperature, during normal steady-state operation, indicates a system malfunction and should be closely-monitored for other engine malfunction symptoms. An increase in oil temperature could be related to the IDG oil cooling system. To reduce the increase in oil temperature rise before limits are reached, the following are recommended: Reduce GEN load, or turn off GEN. If the oil temperature continues to rise, mechanically disconnect the IDG.
	OIL QTY < 2.5 Qts	The oil quantity in the tank can decrease at high thrust setting due to the effect of oil gulping. In that case, the indicated oil quantity will increase after thrust reduction. Monitor the affected engine oil parameters and crosscheck with the other engine - As long as the oil temperature and the oil pressure of the affected engine remain within limits, normal engine operation is not affected. If the oil quantity continues to decrease, the ECAM alert ENG 1(2) OIL LO PRcan be triggered (*Refer to PRO-ABN-ENG ENG 1(2) OIL LO PR - ANNUNCIATION*)
	NAC TEMP > 260 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5.7 units N2 ≥ 5.6 units	(*Refer to PRO-ABN-ENG [QRH] HIGH ENGINE VIBRATION*)

SYSTEM RESET - GENERAL

Applicable to: ALL

Ident.: PRO-ABN-ABN-RST-A-00012106.0001001 / 04 MAY 23

To recover a system that operates abnormally, the flight crew can perform an authorized system reset with the use of:

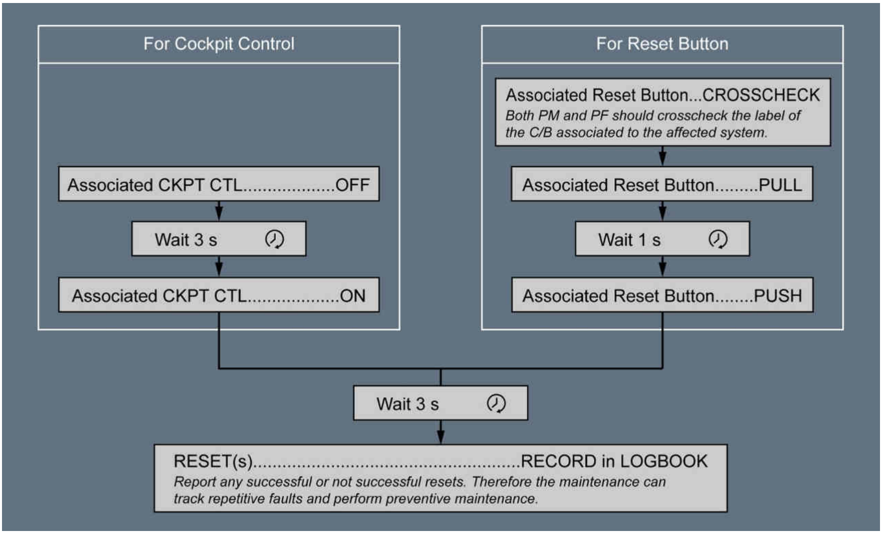
- The associated cockpit control (CKPT CTL),
- The associated reset button.

- **To know if a system reset is authorized, the flight crew applies the following guidelines:**

<table>
<tr><th>On Ground</th><th>or</th><th colspan="2">In Flight</th></tr>
<tr><td colspan="3">• If ECAM/OEB/QRH procedure requests a reset,
or
• If the system malfunction is listed and authorized in the system reset table.</td><td>Reset authorized</td></tr>
</table>

WARNING In all other cases: RESET NOT AUTHORIZED.

- **To perform a reset, unless there is a specific reset procedure defined in the ECAM/FCOM/QRH or in the system reset table, the flight crew applies the following standard reset procedure:**



For Cockpit Control

Associated CKPT CTL..................OFF

Wait 3 s

Associated CKPT CTL..................ON

For Reset Button

Associated Reset Button...CROSSCHECK

Both PM and PF should crosscheck the label of the C/B associated to the affected system.

Associated Reset Button.........PULL

Wait 1 s

Associated Reset Button........PUSH

Wait 3 s

RESET(s)...RECORD in LOGBOOK

Report any successful or not successful resets. Therefore the maintenance can track repetitive faults and perform preventive maintenance.

WARNING	Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

Note: *Manual reset on ground triggers complete power up test.*

SYSTEM RESET TABLE

Applicable to: LV-GKO

COM	CIDS	2		**In flight or on ground:** Apply standard reset procedure. In the event of active CIDS reset (usually CIDS 1 when both are operative), a complete power-up test is performed. - In flight, test lasts about 20 s: • The cabin light comes on at full intensity If selected, dimming is lost and must be reselected after the test • PA, CALL and INTERPHONE functions are interrupted and have to be reselected after the test • FAP cabin temperature corrections are lost, and have to be reselected after the test. - On ground, test lasts about 80 s, and includes additionally: • A sequencial cabin loudspeakers test (triggers a tone for about 10 s) • The cabin light might flash shortly. Dimming selection is lost (as in flight). *Note:* *After a CIDS reset is performed, the following messages may be displayed temporarily on the ECAM:* - *SMOKE LAVATORY DET FAULT* - *SMOKE VIDEO 1(2)(3)(4) DET FAULT* ◁ .
	ACP/AMU	2		**In flight or on ground:** Apply standard reset procedure.
	RMP		ON/OFF CTL	In the case of freezing of one RMP (impossibility to interchange the ACTIVE and STBY radio navigation or communication frequencies,...), all the RMP's have to be reset, one after the other, to recover a normal operation. **In flight or on ground:** - Set the ON/OFF selector to the OFF position on the RMP panel - Wait at least 5 s - Set the ON/OFF selector to the ON position
	PAX SATCOM SYSTEM ◁		ON/OFF CTL	PAX SATCOM may be reset when PAX communication system is lost. **In flight or on ground:** - Set the PAX SATCOM pb-sw to the OFF position

BRAKES	Braking malfunction		BSCU	**In flight** Not authorized. **On ground:** If BRAKES RESIDUAL BRAKING: - STOP aircraft - Set PARK BRK handle to ON - Set A/SKID & N/W STRG sw to OFF - Set A/SKID & N/W STRG sw to ON. If WHEEL N/W STRG FAULT: • **Case A** If the three conditions below are fulfilled: - the WHEEL N/W STRG FAULTalert was triggered just after engine start - the NW STRG DISC memo was displayed before the start of the pushback (before the aircraft starts moving) - the NW STRG DISC memo remained displayed even after the pushback is finished (On the NLG electrical deactivation box, the nosewheel steering selector bypass pin is removed and the lever is set back in the steering position). Apply the below reset procedure. If the ECAM alert disappears after the reset, the flight crew may continue the flight without troubleshooting. • **Case B** In all other cases, including in case of doubt on the above conditions, maintenance action is due, even if the ECAM alert disappears after the reset. For a return to the gate: - Apply the below reset procedure - The taxi speed must not exceed 10 kt. ■ **Reset Procedure** - STOP aircraft - Set PARK BRK handle to ON - Confirm that towing bar is disconnected - Set A/SKID & N/W STRG sw to OFF

MISC	VSC		Cabin aft C/B panel (VACUUM TOILET SYSTEM)	**On the ground or in flight** If all toilets on one or both sides of the aircraft are shut down, apply the following reset: - RESET VACUUM TOILET SYSTEM (blue pb) The repeated use of the blue pb is not recommended. **If not successful and there is no waste tank overfill** Apply the following procedure on one or both system sides: - PULL C/Bs SYSTEM and VACUUM GEN - PULL C/Bs LAVATORY POWER - WAIT 10 s - PUSH C/Bs LAVATORY POWER - PUSH C/Bs SYSTEM and VACUUM GEN. **If still unsuccessful and there is no waste tank overfill** Apply the following procedure on one or both system sides: - PULL C/Bs SYSTEM and VACUUM GEN - PULL C/Bs LAVATORY POWER - PUSH C/Bs LAVATORY POWER - C/Bs SYSTEM and VACUUM GEN remain pulled. In this configuration, all of the following apply: - The waste quantity indication is lost - The protection against the waste tank overfill is lost - When the aircraft is below 16 000 ft do not use the toilets - On the ground, during servicing, do not use the toilets.

ECAM System	**Affected System**	**OVHD RESET Panel**	**System Control Panel**	**Reset Procedure**
VENT	VENT CONT	2		If, in flight, the SMOKE CAB REST SMOKEwarning has been temporarily displayed and identified as a false warning, crew rest compartment ventilation may be recovered by resetting both VENT controller channels (simultaneously pull both ventilation controller RESET pb for at least 5 s, then push them).
	AEVC	1		Apply standard reset procedure.

[QRH] DOUBLE AOA HEAT FAILURE

Ident.: PRO-ABN-A-ICE-00018753.0001001 / 17 MAR 17
Applicable to: LV-FVI, LV-KAN, LV-KAO, LV-KHU

In the case of double failure of alpha probe heaters, the choice made by the computers among the 3 ADR values may be erroneous.

One of affected ADRs ....OFF

NAV ADR 1(2)(3) FAULT
In the case of disagreement between the two remaining ADRs, the NAV ADR DISAGREE ECAM or the NAV AOA DISAGREEECAM alert will trigger.

A.ICE CAPT + F/O AOA HEAT

Applicable to: LV-FVH, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT

Ident.: PRO-ABN-A-ICE-AG-00021007.0001001 / 14 FEB 17

A.ICE CAPT + F/O AOA HEAT (Cont'd)

Ident.: PRO-ABN-A-ICE-AG-00021008.0002001 / 14 MAY 19

L2 In the case of simultaneous AOA probes icing and if the AOA probes are blocked at the same value, ADR 1 and ADR 2 AOA values will be coherent, but incorrect. Therefore, flight controls will consider the remaining correct source as being faulty, and will reject the only correct source. The following ECAM procedure avoids that the flight controls use two erroneous, but coherent, AOA sources.

L1 ■ **If all probes heating is lost on the CAPT and/or F/O side:**

PROBE/WINDOW HEAT..ON

L2 *In some failure conditions, probe heating may be recovered.*

L1 ● **IF UNSUCCESSFUL:**

ADR 1(2) P/B..OFF

L2 *Depending on the status of the static, pitot and TAT heating, the procedure requires that either ADR 1 or 2 be switched OFF.*

Note: In the case of subsequent, significant, AOA discrepancy between the two remaining ADRs, the NAV ADR DISAGREE or NAV AOA DISAGREE alert will trigger.

L1 ■ **In all other cases**

ADR 1(2) P/B..OFF

L2 *Depending on the status of the static, pitot and TAT heating, the procedure requires that either ADR 1 or 2 be switched OFF.*

Note: In the case of subsequent, significant, AOA discrepancy between the two remaining ADRs, the NAV ADR DISAGREE or NAV AOA DISAGREE alert will trigger.

L2 In the case of simultaneous pitot icing and in the same amount, ADR 1, ADR 2, and ADR 3 speeds will be in agreement, but incorrect. The following ECAM procedure avoids that the flight controls use erroneous, but coherent, sources.

L1
- **If all probes heating is lost on the CAPT and/or F/O and/or STBY side:**

  PROBE/WINDOW HEAT.......... ON

- **IF UNSUCCESSFUL:**

  ADR 1(2)(3) P/B.......... OFF

L2 *Depending on the status of the static, AOA, and TAT heating, the ECAM requires that either ADR 1, 2 or 3 be switched OFF.*

Note: In the case of subsequent, significant, speed discrepancy between the two remaining ADRs, the "ADR DISAGREE" ECAM caution will trigger.

L1
  - **IF ICING EXPECTED:**

    ADR 2(3) P/B.......... OFF

L2 *Depending on the status of the static, AOA, and TAT heating, the ECAM requires that either ADR 2 or 3 be switched OFF.*

L1 UNREL SPD PROC.......... APPLY

L2 *Only one ADR is available, and the corresponding pitot probe may be affected by ice accretion. Be prepared to use the UNRELIABLE SPEED INDICATION procedure (Refer to PRO-ABN-NAV Unreliable Speed Indication - Memory Items).*

L12

ASSOCIATED PROCEDURES

NAV ADR FAULT

Single ADR FAULT or double ADR FAULT ECAM cautions may trigger, depending on the number of ADR switched OFF.

BRAKES RESIDUAL BRAKING (Cont'd)

Ident.: PRO-ABN-BRAKES-AA-00019103.0004001 / 21 MAR 17

Maintenance action is due.

ON BRAKE 1(2, 3, 4, 5, 6, 7, 8)

L2 ■ **On ground:**

On ground, the flight crew may attempt a BSCU reset since the BRAKES RESIDUAL BRAKING ECAM caution may be spurious, due to :

- Drifted pressure transducer, after aircraft electrical power-up, or
- BSCU detection of residual pressure decay after brake release.

The aircraft must be stopped, and the parking brake applied, before the flight crew switches the A/SKID & N/W STRG sw OFF then ON.

L1 ■ **In flight:**

L2 For simplification purposes, the following procedure must be applied in all residual braking cases (of the normal or alternate system), even if some actions are not really necessary in the case of actual residual pressure on the normal braking system.

L1 A/SKID NWS....KEEP ON
BRAKE PEDAL....SEVERAL USE

L2 *Press the brakes pedals several times. This could zero a residual pressure on the alternate system.*

L1 ● **IF STILL RESIDUAL BRKG :**
AUTO BRK.... MED

L2 *Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels alternate pressure.*

L1 ● **IF PEDAL BRAKING ONLY :**
JUST AFTER TOUCHDOWN :
BRK PEDAL....USE

L2 *If the autobrake is not available, pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled via the pedals.

L1
L2 Note: *In the case of taxi with deflated or damaged tires, Refer to LIM-LG Taxi with Deflated or Damaged Tires.*

COND LAV+GAL VENT FAULT ◁ (Cont'd)

Ident.: PRO-ABN-COND-AX-00018231.0001001 / 21 MAR 16

L2 On ground, cabin zone temperature sensors are normally ventilated by air extracted by the fan. Therefore, when the fan is faulty, the cabin zone inlet duct temperature is constant and no cabin temperature indication is available on the ECAM. Moreover, cockpit temperature regulation is normal.
Failure of the lavatories and galleys ventilation system also results in the loss of the Video Control Center ◁ (VCC) ventilation on ground.

[QRH] DISPLAY UNIT FAILURE

Ident.: PRO-ABN-EIS-00020989.0003001 / 28 MAY 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

- **If DU blank (with or without large F), or distorted, or brightness reduced to minimum:**

  DU brightness knob (affected DU)..........OFF THEN ON

  Display recovers after 10 s.

  - **If unsuccessful:**

    DU brightness knob (affected DU)..........AS RQRD

    The DU can be switched off.

    CONSIDER ECAM/ND XFR

    CONSIDER PFD/ND XFR

- **If INVALID DISPLAY UNIT message displayed:**

  This may be caused by a DU failure.

  WAIT AT LEAST 40 s FOR AUTOMATIC DU RECOVERY

  - **If DU not recovered:**

    DU brightness knob (affected DU)..........AS RQRD

    The DU can be switched off.

- **If INVALID DATA message displayed (not on all DUs):**

  This failure may be due to a DMC FAULT, or a communication interruption between the DMC and DU.

  CONSIDER DMC SWITCHING (EFIS OR ECAM)

  - **If unsuccessful:**

    DU brightness knob (affected DU)..........OFF THEN ON

    Note: The ND display may disappear in case too many waypoints and associated information are displayed. Reduce ND range, or deselect WPT or CSTR, and the ND display may automatically recover after about 30 s.

- **If INVALID DATA message displayed on all DUs:**

  AP, A/THR AND MCDU NAVIGATION DATA AVAILABLE

  WAIT AT LEAST 40 s FOR AUTOMATIC DU RECOVERY

  - **If one or more DUs not recovered:**

    DUs brightness knob (all affected DUs)..........OFF

    WAIT AT LEAST 40 s

Continued on the following page

[QRH] DISPLAY UNIT FAILURE (Cont'd)

DU brightness knob (one by one).. ON

- **If INVALID DATA message displayed on all DUs, when switching a given DU back ON:**

  FAULTY DU brightness knob.. OFF AND KEEP OFF

  REPEAT PROCEDURE

  Repeat the procedure starting at: If INVALID DATA message displayed on all DUs.

- **If INVALID DATA message displayed on ECAM DUs (E/WD and SD):**

  ECAM DMC SWITCHING...2

  This action permits the recovery of both ECAM DUs.

- **If inversion of E/WD and SD:**

  ECAM UPPER DISPLAY brightness knob..OFF THEN ON

  The action on the ECAM LOWER DISPLAY brightness knob produces the same effect.

ANNUNCIATIONS

Triggering Conditions:

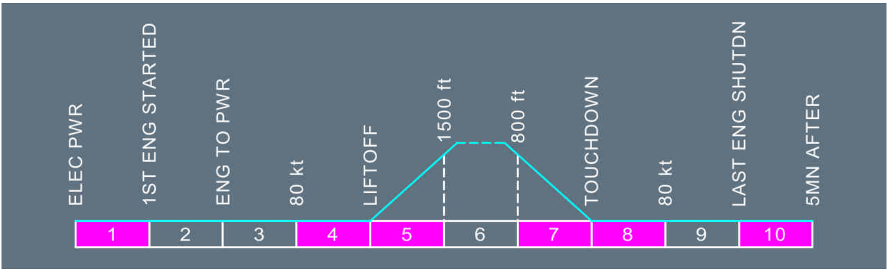
L2 The alert ELEC IDG 1(2) OIL LO PR triggers when the IDG oil pressure is low. The alert is inhibited if N2 < 14%.
The alert ELEC IDG 1(2) OIL OVHT triggers when the IDG outlet oil temperature is above 185 °C.

Flight Phase Inhibition:



Ident.: PRO-ABN-ELEC-J-00018627.0001001 / 03 MAY 23

IDG (AFFECTED)...OFF

L2 *If the associated engine is running, the IDG must be disconnected from the engine at or above idle to prevent the damage to the disconnect mechanism.*

L1 *Note:* *The IDG disconnection is inhibited, when the engine is stopped or below idle.*
Press the IDG pb-sw until the GEN FAULT light comes on. However, do not press for more than 3 s, to avoid damage to the disconnect solenoid.
The IDG FAULT light goes off, when the IDG is disconnected.

L2 *When the IDG is disconnected before takeoff, the oil temperature of the affected IDG may reach a higher value than during normal operations, but without exceeding 150 °C.*

L2 The flight crew must apply this paper procedure when required by the ENG ALL ENGINES FAILURE ECAM alert.

During the application of the ALL ENGINES FAILURE paper procedure:
- If one or more engines relight, apply the corresponding ECAM procedure instead, or
- If none of the engines relights, continue to apply the ALL ENGINES FAILURE paper procedure. If there is sufficient time, clear both the ECAM alerts and the ECAM STATUS page.

The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator.

The ALL ENGINES FAILURE paper procedure includes a fuel quantity check to determine if either of the following applies:
- Engine relight can be attempted, or
- Engine relight cannot be attempted.

If engine relight can be attempted, the flight crew can attempt successive engine relights. First without the APU bleed (windmill start), then with the APU bleed, if available.
If engine relight cannot be attempted, the flight crew must apply the procedure for forced landing or ditching.

L1 First apply the following actions of the ENG ALL ENGINES FAILURE ECAM procedure (if not already applied):

LAND ASAP

RAT....................MAN ON
EMER ELEC PWR MAN ON pb....................PRESS
OPTIMUM RELIGHT SPEED....................270/0.82

[QRH] ENGINE FUEL SYSTEM CONTAMINATION

Ident.: PRO-ABN-ENG-00013976.0006001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

This procedure must be applied if one of the two following conditions is encountered. In that case, a fuel contamination can be highly suspected.

- **If ENG 1(2) CTL SYS FAULT alert triggered associated with AVOID RAPID THR CHANGES or ENG 1(2) AT IDLE, and with rapid and continuous N1 fluctuation indications on both engines:**
  A/THR.......OFF
  - **If N1 fluctuations stop on both engines:**
    ECAM PROC.......APPLY
    A/THR.......KEEP OFF
  - **If N1 fluctuations continue on both engines:**

    FUEL CONTAMINATION CONFIRMED

    Apply condition: If fuel contamination confirmed
- **If ENG 1 CTL SYS FAULT and ENG 2 CTL SYS FAULT alerts triggered with AVOID RAPID THR CHANGES or ENG 1(2) AT IDLE:**
  A/THR.......OFF

  FUEL CONTAMINATION CONFIRMED

  Apply condition: If fuel contamination confirmed

This procedure must be applied if a fuel contamination has been confirmed. This fuel contamination may result, in the worst case, in a loss of engine thrust control. This procedure aims at maintaining the thrust on one engine while minimizing the thrust changes on the other, in order to prevent contaminant from blocking the mechanical devices of engine thrust regulation.

In case of ENG 1(2) CTL SYS FAULT on only one engine:
- Set and maintain the thrust on the engine affected by the ECAM caution
- Minimize the thrust changes on the engine not affected by the ECAM caution

In case of ENG 1 and 2 CTL SYS FAULT (both engines affected by the ECAM caution):
- Set and maintain the thrust on the first engine affected by the ECAM caution
- Minimize the thrust changes on the second engine affected by the ECAM caution

● **If fuel contamination confirmed:**

LAND ASAP

A/THR.......KEEP OFF

Continued on the following page

[QRH] ENGINE FUEL SYSTEM CONTAMINATION (Cont'd)

MAN THR (1st affected engine)..SET and MAINTAIN

MAINTAIN THRUST UNTIL FINAL APPROACH

THRUST SETTING (N1)													
	GROSS WEIGHT *(1 000 kg)*												
	120	***130***	***140***	***150***	***160***	***170***	***180***	***190***	***200***	***210***	***220***	***230***	***240***
N1(%)	*71.4*	*72.1*	*72.9*	*73.7*	*74.5*	*75.5*	*76.5*	*77.5*	*78.5*	*79.6*	*80.8*	*81.8*	*83.0*

- **In cruise:**

  MAN THR (other engine)..SET AS RQRD

  MINIMIZE THRUST CHANGES

- **For descent:**

  MAN THR (other engine).. IDLE

  SPD BRK... AS RQRD

  Level-off at approximately 3 000 ft AGL and 20 NM from the runway threshold.

- **For landing:** RESUME NORMAL SOP

  Resume normal operations: Retard thrust levers as usual, select reverse thrust and apply brakes as required.

  USE FLAP FULL

  When fully configured:

  - *In case of overspeed adjust the thrust on the 1st affected engine*
  - *If the speed trend decreases below VAPP, adjust the thrust on the other engine.*

[QRH] ENGINE FUEL SYSTEM CONTAMINATION

Ident.: PRO-ABN-ENG-00013976.0001001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

This procedure must be applied if one of the two following conditions is encountered. In that case, a fuel contamination can be highly suspected.

- **If ENG 1(2) CTL SYS FAULT alert triggered associated with AVOID RAPID THR CHANGES or ENG 1(2) SLOW RESPONSE, and with rapid and continuous EPR fluctuation indications on both engines:**
  A/THR.......................................OFF
  - **If EPR fluctuations stop on both engines:**
    ECAM PROC.......................................APPLY
    A/THR.......................................KEEP OFF
  - **If EPR fluctuations continue on both engines:**

    FUEL CONTAMINATION CONFIRMED

    Apply condition: If fuel contamination confirmed
- **If ENG 1 CTL SYS FAULT and ENG 2 CTL SYS FAULT alerts triggered with AVOID RAPID THR CHANGES or ENG 1(2) SLOW RESPONSE:**
  A/THR.......................................OFF

  FUEL CONTAMINATION CONFIRMED

  Apply condition: If fuel contamination confirmed

This procedure must be applied if a fuel contamination has been confirmed. This fuel contamination may result, in the worst case, in a loss of engine thrust control. This procedure aims at maintaining the thrust on one engine while minimizing the thrust changes on the other, in order to prevent contaminant from blocking the mechanical devices of engine thrust regulation.

In case of ENG 1(2) CTL SYS FAULT on only one engine:
- Set and maintain the thrust on the engine affected by the ECAM caution
- Minimize the thrust changes on the engine not affected by the ECAM caution

In case of ENG 1 and 2 CTL SYS FAULT (both engines affected by the ECAM caution):
- Set and maintain the thrust on the first engine affected by the ECAM caution
- Minimize the thrust changes on the second engine affected by the ECAM caution

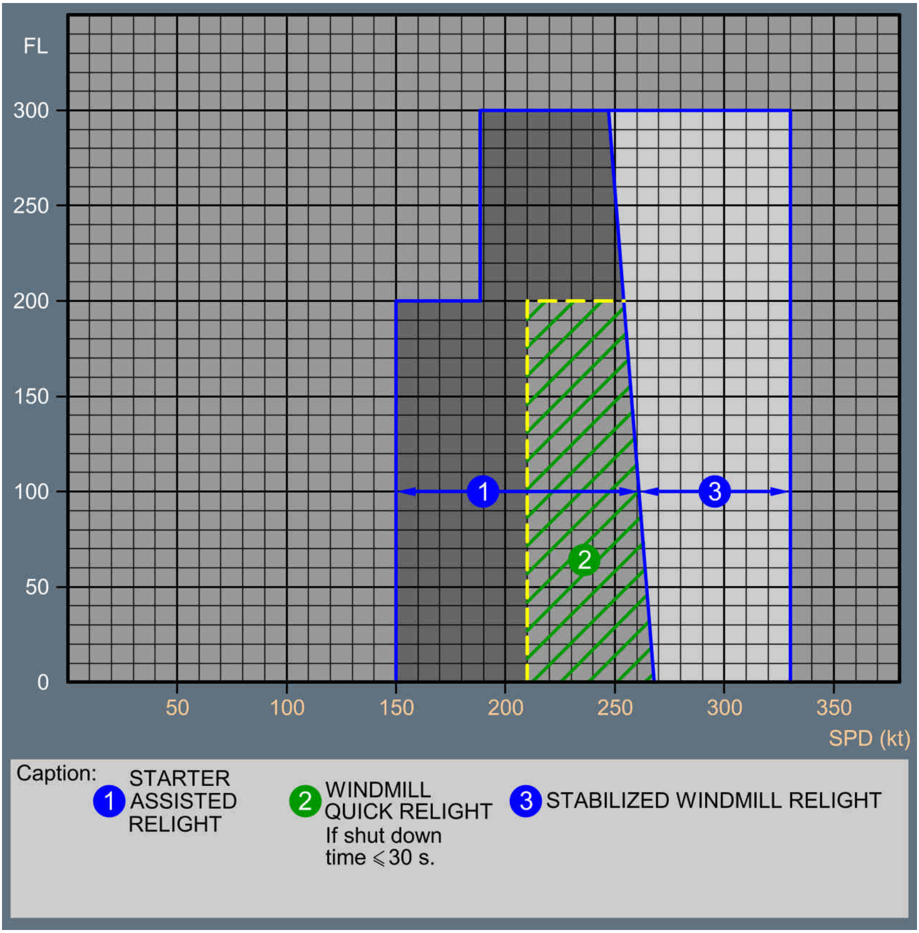
[QRH] ENG RELIGHT
IN FLIGHT

Ident.: PRO-ABN-ENG-00011616.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

Engine Relight Envelope



MAX GUARANTEED ALTITUDE : 30 000 ft

Continued on the following page

[QRH] ENG RELIGHT (Cont'd)
IN FLIGHT

ENG MASTER (affected engine)........................OFF
THR LEVER (affected engine)........................IDLE
ENG START sel........................IGN / START
X BLEED........................OPEN

If outside windmilling start envelope, FADEC opens starter valve.

WING ANTI ICE (for starter assisted start)........................OFF
ENG MASTER........................ON
ENG PARAMETERS (N3, EGT)........................MONITOR

Engine light up should be achieved within 30 s after fuel flow increases.

- *Monitor N3*
- *If uncertain about successful relight, move the thrust lever forward and check engine response.*

■ **When idle reached (ENG AVAIL):**

ENG START sel........................NORM
TCAS MODE sel........................TA/RA

Check that the selector is at TA/RA since if the ENG SHUT DOWN procedure has been applied, the TCAS mode selector may have been set at TA position.

X BLEED........................AUTO
Affected SYS........................RESTORE

■ **If no relight:**

ENG MASTER (affected engine)........................OFF

Wait 30 s before new start attempt (to drain the engine).

[QRH] ENG RELIGHT
IN FLIGHT

[QRH] ENG STALL

Ident.: PRO-ABN-ENG-00018671.0001001 / 12 MAY 23
Applicable to: ALL

THR LEVER (affected engine)..IDLE
ENG PARAMETERS (affected engine)..CHECK

- **If abnormal ENG parameters:**

  ENG MASTER (affected engine)..OFF

  ENG 1(2) SHUT DOWN

  Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN.
  Engine restart at crew discretion.

- **If normal ENG parameters:**

  ENG ANTI-ICE (affected engine)..ON
  WING ANTI-ICE..ON

  Operation of the engine and wing anti-ice will increase the stall margin but EGT will increase accordingly.

  THR LEVER (affected engine)..SLOWLY MOVE FORWARD

  - **If stall does not recur:**

    CONTINUE NORMAL ENG OPERATION

[QRH] ENGINE TAILPIPE FIRE

Ident.: PRO-ABN-ENG-00011797.0001001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Internal engine fire may be encountered during engine start or engine shutdown.
It may be seen by the ground crew, or the EGT may fail to decrease after the ENG MASTER lever is turned off.

CAUTION	External fire agents can cause severe corrosive damage. Consider the use of external fire agents only if the following procedure does not stop engine tailpipe fire.

ENG MASTER (affected engine)...OFF

Note: Do not press the ENG FIRE pb-sw, since this would cut off the FADEC power supply, which would prevent motoring sequence.

ESTABLISH AIR BLEED PRESS

Select the APU, or opposite ENG BLEED, to motor the engine.
If APU BLEED is not available, and the other engine is shut down, connect external pneumatic power (if readily available).

BEACON...ON

- **When N2 < 30 %:**
  ENG START sel...CRANK
  ENG MAN START pb (affected engine)...ON
  The start valve automatically reopens, when N2 is below 15 %.
- **When fire stopped:**
  ENG MAN START pb (affected engine)...OFF
  ENG START sel...NORM
  Maintenance action is due.

[QRH] ENGINE TAILPIPE FIRE

Ident.: PRO-ABN-ENG-00011797.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

Internal engine fire may be encountered during engine start or engine shutdown.
It may be seen by the ground crew, or the EGT may fail to decrease after the ENG MASTER lever is turned off.

CAUTION	External fire agents can cause severe corrosive damage. Consider the use of external fire agents only if the following procedure does not stop engine tailpipe fire.

ENG MASTER (affected engine)..OFF

Note: *Do not press the ENG FIRE pb-sw, since this would cut off the FADEC power supply, which would prevent motoring sequence.*

ESTABLISH AIR BLEED PRESS

Select the APU, or opposite ENG BLEED, to motor the engine.
If APU BLEED is not available, and the other engine is shut down, connect external pneumatic power (if readily available).

BEACON..ON

- **When N3 < 30 %:**
  ENG START sel..CRANK
  ENG MAN START pb (affected engine)..ON
  The start valve automatically reopens, when N3 is below 10 %.
- **When fire stopped:**
  ENG MAN START pb (affected engine)..OFF
  ENG START sel..NORM
  Maintenance action is due.

[QRH] HIGH ENGINE VIBRATION

Ident.: PRO-ABN-ENG-00011798.0003001 / 28 SEP 17
Applicable to: LV-KHT, LV-KHU

The vibration advisory on ECAM (N1 greater than 3.3 units, N2 greater than 2.6 units, N3 greater than 4.0 units) is mainly a guideline for the flight crew to monitor engine parameters more closely. The ECAM vibration advisory alone does not require engine shut down.

Note: *1. High engine vibration may be accompanied by cockpit and cabin smoke and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.*
2. High N1 vibration are generally accompanied by perceivable airframe vibrations. High N2, N3 vibration can occur without perceivable airframe vibrations.

ENG PARAMETERS..CHECK

Check engine parameters and especially EGT; crosscheck with other engine. Report in maintenance logbook.

■ **If icing suspected:**

An increase of N1 vibration in icing conditions with or without engine anti-ice may be due to fan blades and/or spinner icing. Icing may be suspected if N1 vibration occurs without other engine parameters variation.

A/THR..OFF
THRUST (one engine at a time)....................IDLE THEN INCREASE N1 > 80 %

Reduce thrust to idle if flight conditions permit.
If ENG ANTI ICE is off, switch it ON ***at idle fan speed,*** *one engine after the other with approximately 30 s interval.*
To shed ice, it may be necessary to perform several thrust variations between idle and a thrust compatible with the flight phase. For efficient ice shedding, thrust should be increased to at least 80% N1 if flight conditions permit.
After each thrust variation, vibrations should decrease, indicating the progress of the ice shedding.
When the ice is shed, vibrations should return to normal and the flight crew can resume normal engine operation.

■ **If icing not suspected:**

● **If above vibration advisory and flight conditions permit:**
THRUST (affected engine)..............REDUCE BELOW ADVISORY THRESHOLD

Continued on the following page

[QRH] HIGH ENGINE VIBRATION (Cont'd)

If flight conditions permit, reduce thrust to maintain vibration level below the advisory threshold. If the VIB indication does not decrease following thrust reduction, this may indicate other problems on the engine.

- **After landing, if vibrations continue :** SHUT DOWN ENGINE WHEN POSSIBLE

[QRH] HIGH ENGINE VIBRATION

Ident.: PRO-ABN-ENG-00011798.0005001 / 28 SEP 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The vibration advisory on ECAM (N1 greater than 5.7 units, N2 greater than 5.6 units) is mainly a guideline for the flight crew to monitor engine parameters more closely.
The ECAM vibration advisory alone does not require engine shut down.

Note: 1. *High engine vibration may be accompanied by cockpit and cabin smoke and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.*
2. *High N1 vibration are generally accompanied by perceivable airframe vibrations. High N2 vibration can occur without perceivable airframe vibrations.*
3. *High N2 vibrations may be experienced during the descent. It should decrease below advisory level within approximately 2 minutes without necessitating crew action as long as other engine parameters are normal. Report to maintenance.*

ENG PARAMETERS..CHECK

Check engine parameters and especially EGT; crosscheck with other engine. Report in maintenance logbook.

- **If icing suspected:**

  An increase of N1 vibration in icing conditions with or without engine anti-ice may be due to fan blades and/or spinner icing. Icing may be suspected if N1 vibration occurs without other engine parameters variation.

  A/THR..OFF
  THRUST (one engine at a time)........................ IDLE THEN INCREASE N1 > 80 %

  Reduce thrust to idle if flight conditions permit.
  If ENG ANTI ICE is off, switch it ON ***at idle fan speed,*** *one engine after the other with approximately 30 s interval.*
  To shed ice, it may be necessary to perform several thrust variations between idle and a thrust compatible with the flight phase. For efficient ice shedding, thrust should be increased to at least 80% N1 if flight conditions permit.
  After each thrust variation, vibrations should decrease, indicating the progress of the ice shedding.
  When the ice is shed, vibrations should return to normal and the flight crew can resume normal engine operation.

Continued on the following page

[QRH] HIGH ENGINE VIBRATION (Cont'd)

■ **If icing not suspected:**

- **If above vibration advisory and flight conditions permit:**
  THRUST (affected engine)............................REDUCE BELOW ADVISORY THRESHOLD
  If flight conditions permit, reduce thrust to maintain vibration level below the advisory threshold. If the VIB indication does not decrease following thrust reduction, this may indicate other problems on the engine.

- **After landing, if vibrations continue :** SHUT DOWN ENGINE WHEN POSSIBLE

[QRH] ON GROUND - NON ENG SHUTDOWN AFTER ENG MASTER OFF

Ident.: PRO-ABN-ENG-00020610.0001001 / 28 MAY 20
Applicable to: ALL

The normal procedure to shut down an engine is to set the ENG MASTER lever to OFF. In the case where the engine does not shut down as expected, use the following procedure:

ECAM FUEL PAGE...SELECT
LP FUEL VALVE POSITION (affected engine)..CHECK

■ **If LP fuel valve closed (cross line amber):**

NO CREW ACTION

■ **If LP fuel valve open:**

ENG FIRE pb-sw (affected engine)...PRESS
Using the engine fire pushbutton will force the LP fuel valve to close. The engine will shut down after a time delay.

GROUND CREW..NOTIFY

IN BOTH CASES, ENGINE WILL SHUT DOWN AFTER A TIME DELAY UP TO 1 MIN 30 S
The engine shuts down when the remaining fuel between the LP *fuel valve and the nozzles is burned. The time delay for engine shutdown depends on airport altitude and fuel recirculation system operation.*

[QRH] ONE ENGINE INOPERATIVE - CIRCLING APPROACH

Ident.: PRO-ABN-ENG-00010065.0014001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

ENG ALL ENGINES FAILURE (Cont'd)

Ident.: PRO-ABN-ENG-DM-00017079.0015001 / 04 SEP 17

L2 The ENG ALL ENGINES FAILURE ECAM alert inhibits the ELEC EMER CONFIG ECAM alert, and provides the flight crew with an associated procedure to immediately apply in the case of a failure of all engines. The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator. Then, the ENG ALL ENGINES FAILURE ECAM procedure specifies that the flight crew must apply the ALL ENGINES FAILURE QRH procedure.

ENG 1(2) FAIL (Cont'd)

Ident.: PRO-ABN-ENG-BC-00018582.0010001 / 07 JUL 20

L2 An engine flame-out may be recognized by a rapid decrease in EGT, N2, FF, followed by a decrease in N1.

Engine damage may be accompanied by:
- Explosions
- Significant increase in aircraft vibrations and/or buffeting
- Repeated, or uncontrollable engine stalls
- Associated abnormal indications, such as hydraulic fluid loss, no N2 (N2 or N3 for RR engines) indication.

L1 **LAND ASAP**

■ In the case of SHAFT FAILURE (for RR engines):

L2 The FADEC automatically shuts down the engine.

L1 **● During takeoff phase:**

L/G.. UP

THR LEVER (AFFECTED ENGINE).. IDLE
ENG MASTER (AFFECTED ENGINE)..OFF
ENG FIRE P/B (AFFECTED ENGINE)..PUSH
AGENT 1..DISCH
L+R INR TK SPLIT...ON

■ Before takeoff, or after landing:

THR LEVER (AFFECTED ENGINE).. IDLE
ENG MASTER (AFFECTED ENGINE)..OFF

■ IF DAMAGE:

ENG FIRE P/B (AFFECTED ENGINE).. PUSH
AGENT 1.. DISCH
L + R INR TK SPLIT.. ON

■ IF NO DAMAGE:

ENG (AFFECTED) RELIGHT...CONSIDER

L12

ASSOCIATED PROCEDURES

ENG 1(2) SHUT DOWN

Continued on the following page

ENG 1(2) FAIL (Cont'd)

Apply the ENG 1(2) SHUT DOWN procedure (Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN), if damage, or if engine relight is unsuccessful.

- **In flight:**

ENG START SEL.. IGN

L2 *Selection of continuous ignition confirms the FADEC's immediate relight attempt. It also protects the remaining engine.*

L1 ● **During takeoff phase:**

L/G.. UP

THR LEVER (AFFECTED ENGINE).. IDLE

L2 *Note: In the case of GPWS (EGPWS ◁) alerts, reduce speed with care below VLS with the flaps extended (at light weights VMCA/VMCL may be reached before α max), when applying the GPWS (EGPWS ◁) procedure.*

L1 ● **IF NO ENG RELIGHT AFTER 30 S:**

L2 The 30 s countdown starts as soon as the ENG 1(2) FAIL alert is triggered.

L1 ENG MASTER (AFFECTED ENGINE).. OFF

■ **IF DAMAGE:**

ENG FIRE P/B (AFFECTED ENGINE).. PUSH

L2 *If the ENG FIRE pb-sw is pushed, the FADEC is no longer supplied.*

L1 AGENT 1 AFTER 10 S.. DISCH

L+R INR TK SPLIT.. ON

L2 *Note: If no fuel leak is evident, set both INR TK SPLIT pb-sw back to the normal position.*

L1 ■ **IF NO DAMAGE:**

ENG (AFFECTED) RELIGHT.. CONSIDER

L2 *Apply the ENG RELIGHT (in flight) procedure (Refer to PRO-ABN-ENG [QRH] ENG RELIGHT IN FLIGHT).*

L12

ASSOCIATED PROCEDURES

ENG 1(2) SHUT DOWN

Apply the ENG 1(2) SHUT DOWN procedure (Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN), if damage, or if engine relight is unsuccessful.

Continued on the following page

ENG 1(2) FAIL (Cont'd)

If high engine vibrations occur and continue after engine shutdown, reduce airspeed and descend to a safe altitude.
Attempt to define, and use, a practical airspeed and altitude for minimum vibrations.
For performance reasons, the landing is in CONF 3. CONF 3 should be selected, as the landing configuration, on the MCDU.

ENG 1(2) FAIL

L2 This alert could indicate a fuel leak downstream of the Fuel Metering Valve (FMV). In such a case, the FUEL F. USED/FOB DISAGREE alert will not be triggered. A low N1 indication may indicate a fuel leak. The flight crew should check fuel parameters to confirm the leak. Check parameters like FOB, FU, fuel flow, fuel distribution, fuel imbalance to confirm the fuel leak.

L1 ● **IF LEAK CONFIRMED:**

THR LEVER (AFFECTED ENGINE).. IDLE
ENG MASTER (AFFECTED ENGINE)..OFF

L12

ASSOCIATED PROCEDURES

ENG 1(2) SHUT DOWN

L2 *Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN.*

ENG 1(2) HP FUEL VALVE

Applicable to: LV-FVH, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT

Ident.: PRO-ABN-ENG-BI-00018389.0001001 / 21 MAR 16

ANNUNCIATIONS

Triggering Conditions:

L2 This alert triggers when fuel valve is failed in close, or open position.

ENG 1(2) STALL (Cont'd)

Ident.: PRO-ABN-ENG-CN-00018674.0003001 / 12 MAY 23

L2 A stall may be indicated by varying degrees of abnormal engine noises, accompanied by flame from the engine exhaust (and possibly from engine inlet in severe cases), fluctuating parameters, sluggish or no thrust lever response, high EGT and/or a rapid EGT rise when thrust lever is advanced. Engine stalls must be reported for maintenance action.

L1
- ■ **If stall detected by FADEC:**
  - ■ **In flight:**
    - ● **For aircraft equipped with RR engines:**

      FUEL ADJUSTED

      L2 *Fuel/Air ratio is automatically decreased until the stall disappears.*

LAND ASAP

- **On the ground:**

  ENG (AFFECTED) AT IDLE

  L2 *FADEC selects idle power automatically.*
  If associated thrust reverser is already deployed, FADEC commands restow.

- L1 **In flight:**

  L2 If the selected thrust lever position at the time of fault detection is:
  TOGA or FLEX: FADEC freezes takeoff or flex takeoff thrust until slat retraction. At slat retraction, the FADEC selects CLB thrust.
  Between IDLE and MCT: In manual thrust setting mode, engine rating increases and freezes at CLB thrust. At slats or landing gear extension, FADEC selects idle power automatically.
  It is possible to activate the A/THR. If selected, A/THR mode will manage thrust between idle and CLB as long as the landing gear is up and the slats are in.

  L1
  - **During takeoff or when slats and landing gear are retracted:**

    ENG (AFFECTED) HI PWR IN MAN THR

    - **If A/THR on:**

      A/THR.. KEEP ON

    - **If A/THR not on:**

      A/THR.. ON

  - **BEFORE SLATS IN:**

    A/THR.. ON

  - **If EIU not avail and FLX/MCT/TOGA selected:**

    ENG (AFFECTED) HI PWR ONLY

    L2 *Engine thrust is frozen at takeoff power.*

[QRH] LANDING WITH SLATS OR FLAPS JAMMED

Ident.: PRO-ABN-F_CTL-00024479.0008001 / 10 MAY 21
Applicable to: LV-KAN, LV-KAO

- **If SLATS jammed at 0 :**

  MAX RECOMMENDED WEIGHT FOR LANDING: 220 t (485 klb)
  FUEL JETTISON....................CONSIDER

LDG DIST PROC....................APPLY

L2 *Determine flap lever position for landing.*

L1 ■ **If SLATS jammed at 0, for approach:**

MANEUVER WITH CARE

Note: *The **OVERSPEED** alert and VLS displayed on the PFD, are computed according to the actual flaps/slats position. Disregard VFE, VFE NEXT displayed on PFD.*

SPD SEL.................... 235 kt
AT 235 kt: SELECT FLAPS LEVER 1
SPD SEL.................... 215 kt

Note:
- *The speed domain may transiently close when selecting CONF 2*
- *Above 220 t (485 klb), it is necessary to temporarily disconnect the A/THR to prevent rapid deceleration down to stall warning and select a speed slightly below VLS. A/THR can be re-engaged when the landing configuration is established*
- *In case of Alpha Prot activation accompanied by Alpha floor, disconnect A/THR and re-engage when speed is no longer in Alpha protection.*

AT 215 kt: SELECT FLAPS LEVER 2

DECELERATE TO 188 kt

L2 *188 kt is the maximum approach speed for aircraft with gross weight close to MTOW in CONF 2*

L1 ■ **If FLAPS jammed, OR if SLATS jammed > 0, for approach:**

Repeat the following until landing configuration is reached:
SPD SEL.................... VFE NEXT -5 kt
AT VFE NEXT: SELECT FLAPS LEVER ONE STEP DOWN

Note:
- *The **OVERSPEED** alert and VLS displayed on the PFD, are computed according to the actual flaps/slats position*
- *VFE and VFE NEXT are displayed on the PFD according to the FLAPS lever position. If not displayed, use the placard speeds*

Continued on the following page

[QRH] LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

- *If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered. In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.*

● **When in landing CONF and in final approach:**

DECELERATE TO CALCULATED VAPP

AP BELOW 500 ft AGL: DO NOT USE

● **For Go-around:**

USE MAX SPEED FROM TABLE BELOW UNLESS ECAM DISPLAYS A LOWER VALUE

MAX SPEED					
Flaps Slats	$F = 0$	$0 < F \leq 1$	$1 < F \leq 2$	$2 < F \leq 3$	$F > 3$
$S = 0$	NO LIMITATION	215 kt	196 kt	186 kt	180 kt
$0 < S \leq 1$	240 kt				
$S > 1$	215 kt	205 kt			

■ **If SLATS FAULT:**

● **For circuit:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **For diversion:**

SELECT FLAPS LEVER 0

■ **If SLATS jammed at 0:**

USE NORMAL OPERATING SPEEDS

■ **If SLATS jammed > 0:**

Recommended speed for diversion: MAX SPEED -10 kt

INCREASED FUEL CONSUMPTION

■ **If FLAPS FAULT:**

● **For circuit:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

Continued on the following page

[QRH] LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

- **For diversion:**
  - **If FLAPS jammed at 0:**

    SELECT FLAPS LEVER 0

    USE NORMAL OPERATING SPEEDS
  - **If FLAPS jammed > 0:**

    MAINTAIN SLATS/FLAPS CONFIGURATION

    Recommended speed for diversion: MAX SPEED -10 kt

    INCREASED FUEL CONSUMPTION

    Note: *In some cases, MAX SPEED -10 kt may be slightly above VFE as VFE is linked to the S/F lever position. However, the Overspeed warning will not trigger as it is based on the actual slats/flaps position.*

CAUTION	For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by the applicable Fuel Penalty Factor provided in the QRH, to obtain the fuel penalty required to reach the destination in the current configuration. *Refer to QRH/OPS Fuel Penalty Factors/ECAM Alert Table*

    SPEED AND TRAJECTORY.......................................STABILIZE ASAP

  - **In case of Engine-Out:**

    APPR SPEED: SPD SEL 170 kt
    SPEED AND TRAJECTORY.......................................STABILIZE ASAP
    AP.......................................OFF
    A/THR.......................................OFF

    FOR GO AROUND: SPD SEL 170 kt

- **For landing:**
  DIFFERENTIAL BRAKING.......................................USE ASAP

  REVERSER: SYMMETRIC USE ONLY

  Use the nosewheel steering handle below 100 kt only in case of RUDDER PEDAL JAM.

[QRH] RUDDER TRIM RUNAWAY

Ident.: PRO-ABN-F_CTL-00019206.0004001 / 17 MAR 17
Applicable to: ALL

USE LATERAL CONTROL TO LEVEL WINGS
USE RUDDER WITH CARE
USE RUDDER PEDALS TO CENTER RUDDER

Check the rudder position on the F/CTL SD page.

Note: *This failure is seen mainly as uncommanded roll (induced by yaw). In most conditions, the aircraft stabilizes in a steady heading sideslip.*
For continued flight, either maintain rudder central or leave the aircraft in a steady stabilized heading sideslip, but ensure that all changes between rudder centralized and steady heading sideslip are made smoothly. As speed is reduced, the FCPC may allow more rudder to be applied by the trim runaway.

USE NORMAL CONF FOR LANDING

F/CTL ELEV REDUND LOST
(AILERONS ARE NOT PRESET)

Applicable to: ALL

Ident.: PRO-ABN-F_CTL-K-00017614.0001001 / 21 MAR 16

ANNUNCIATIONS

Triggering Conditions:

L2 This alert triggers, in case of dual failure, when a subsequent third failure affecting the F/CTL system may lead to degraded pitch control or pitch mechanical backup. Some failure combinations lead to an aileron preset to limit the pitch up effect in case of this third failure. If this third failure occurs, the ELEV REDUND LOST PROC and associated FL and speed limitations no longer apply. In this case, if the MAN PITCH TRIM ONLY message is displayed, it is recommended that the autothrust be disconnected to improve longitudinal control of the aircraft.

MAX SPEED.. *REFER TO PRO-ABN-F_CTL F/CTL FLAPS/SLATS FAULT/LOCKED*

APPR PROC

● **If FLAPS < 3 or 3 < FLAPS < FULL:**

GPWS FLAP MODE...OFF

■ **If slats and flaps are jammed in CONF 0:**

NO S/F LDG PROC...APPLY

Refer to PRO-ABN-F_CTL [QRH] No Flaps no Slats Landing.

FOR LDG..USE FLAP 1

This line is displayed if both SFCCs are lost and F/CTL FLAPS FAULT is displayed. This is replaced by "FOR LDG: USE FLAP 1" when CONF 1 is selected, as a reminder. Selecting FLAP 1 will not result in flaps/slats extension but will enable the engagement of the SRS guidance mode in the case of go-around.

■ **If slats and flaps are not jammed in CONF 0:**

S/F JAMMED PROC..APPLY

Refer to PRO-ABN-F_CTL [QRH] Landing with Slats or Flaps Jammed.

Note: *The ECAM procedure (below) just provides the final flap lever selection for landing, depending on the failed flaps position.*

■ **If FLAPS < 3:**

FOR LDG..USE FLAP 2

This line is replaced by "FOR LDG: USE FLAP 2" when CONF 2 is selected, as a reminder. The selection of

INOP SYS

FLAPS
CAT 2

Continued on the following page

F/CTL FLAPS FAULT/LOCKED (Cont'd)

FLAP 2 instead of FLAP 3 permits the increase of VMAX on the PFD.

- **If FLAPS = 3:**

  FOR LDG..USE FLAP 3

  This line is replaced by "FOR LDG: USE FLAP 3" when CONF 3 is selected, as a reminder.

- **If FLAPS > 3:**

  FOR LDG..USE FLAP FULL

  This line is replaced by "FOR LDG: USE FLAP FULL" when CONF FULL is selected, as a reminder.

Applicable to: ALL

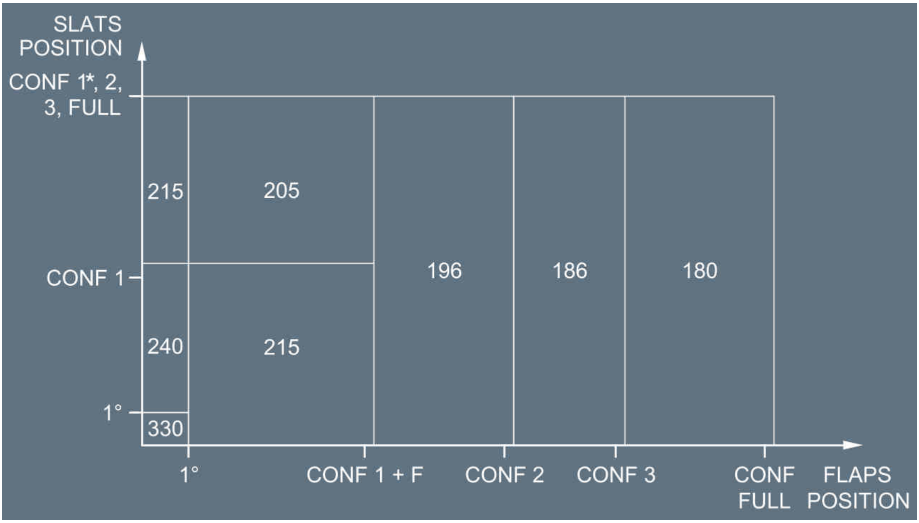
This figure gives the MAX SPEED value displayed on ECAM in case of failure for all Slats/Flaps positions.



VLS					
	0 ≤ Flaps < 1+F	**1+F ≤ Flaps < 2**	**2 ≤ Flaps < 3**	**3 ≤ Flaps < FULL**	**Flaps FULL**
0 ≤ Slats < 1	VREF + 50	VREF + 40	VREF + 30	VREF + 25	VREF + 25
1 ≤ Slats < 2	VREF + 30	VREF + 20	VREF + 15	VREF + 10	VREF + 10
Slats = 2	VREF + 30	VREF + 15	VREF + 10	VREF + 5	VREF

CAUTION For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to fuel flow indication.
As a guideline, determine the fuel consumption in clean configuration at same altitude without airspeed limitation (e.g. from ALTERNATE FLIGHT PLANNING tables, Refer to PER-FPL-FLP-ALN-20 ALTERNATE PLANNING - ISA) and multiply this result by the applicable Fuel Penalty Factor provided in the QRH (Refer to QRH/OPS Fuel Penalty Factors/ECAM Alert Table) to give the fuel penalty required to reach the destination in the current configuration.

L12

STATUS

MAX X WIND FOR LDG: 15 KT

APPR PROC

- **BEFORE AUTOLAND:**
  RUD TRIM (AP OFF).. RESET
  Manual landing is preferred, however autoland can be performed.
  The autopilot normally adjusts the rudder trim by comparing the rudder trim command with the feedback on the rudder pedal. As the rudder pedal is faulty, the autopilot cannot apply rudder trim on the rudder surface, but it still internally computes rudder trim up to its maximum value. During the flight, the AP maintains the correct flight path, necessary by a permanent rudder deflection (as the AP' trim order would have done).
  However, just before landing, during the align mode, the computed maximum rudder trim is added to the rudder demand and could cause lateral deviation. To prevent this, the rudder trim must be reset to its zero position, before the align mode, at around 1 000 ft.
  To perform this reset, the autopilot must be disconnected and then reconnected to perform the autoland.
- **AT LDG ROLL:**
  DIFF BRAKING..AS RQRD

  RESUME NORM BANK ANGLE

  RESUME NORM RUDDER TRIM

  AP.................... AS RQRD

[QRH] FUEL JETTISON

Applicable to: LV-KAN, LV-KAO

Ident.: PRO-ABN-FUEL-10-00025092.0003001 / 08 NOV 21

Fuel jettison is provided for quick reduction of aircraft weight in order to:

- Comply with the approach and landing climb requirements (not required, if the configuration is FLAP 3 for landing)
- Obtain the normal maximum landing weight (if time permits)
- Obtain the planned flight profile in the case of engine failure en route.

It is possible to jettison in any convenient configuration and at any speed. When feasible, the height should be sufficient to avoid contamination on the ground (5 000 ft AGL is considered as adequate).
Do not jettison in a thunderstorm.
When jettison is performed, avoid flying into the jettisoned flow (which is descending at about 500 ft/min).
Average weight reduction (by jettison only) is 1 000 kg/min (2 200 lb/min).

For the inhibition conditions of Jettison operation, please *Refer to DSC-28-10-120 General*.

[QRH] FUEL LEAK

Ident.: PRO-ABN-FUEL-00011327.0002001 / 28 MAY 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

A fuel leak may be detected by:
- The sum of FOB and FU is significantly less than FOB at engine start, or is decreasing, or
- A passenger observes a fuel spray from an engine/pylon, or a wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity of a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- A tank is overflowing (due to pipe rupture in a tank), or
- The Fuel Flow is excessive, N1 is low (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

WHEN A LEAK IS CONFIRMED

LAND ASAP

■ **Leak from engine/pylon confirmed by excessive fuel flow, low N1 or visual check:**

THR LEVER (affected engine)........................IDLE
ENG MASTER (affected engine)........................OFF
WING X FEED........................AS RQRD

DO NOT RESTART AFFECTED ENGINE

■ **Leak from engine/pylon not confirmed or leak not located:**

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing, or from the Center tank, the Trim tank, or the APU/Trim feeding line.

WING X FEED........................MAINTAIN CLOSED

The crossfeed valve must remain closed to prevent the leak from affecting both sides.

L CTR PUMP........................OFF
R CTR PUMP........................OFF
T TANK FEED........................ISOL
INNER TANKS FUEL QUANTITIES........................MONITOR

Monitor the depletion rate of each inner tank.

Continued on the following page

[QRH] FUEL LOSS REDUCTION

Ident.: PRO-ABN-FUEL-00019480.0002001 / 17 MAR 17
Applicable to: ALL

Apply this procedure only if suggested by the FUEL LEAK procedure, and if the flight crew needs to minimize the fuel loss. It covers two types of leak:

- A leak from wing: a manual Trim tank transfer (via the Center tank) and/or manual Center tank transfer can be done, to symmetrically transfer fuel to both inner tanks, and avoid automatic transfer to only the least full inner tank, or
- A leak from the Center tank, or the Trim tank: a manual Trim and/or Center tank transfer to both inner tanks can be done to save some Trim or Center tank fuel.

- **If Center Tank or Trim Tank not empty:**

  L CTR PUMP....................ON
  R CTR PUMP....................ON
  CTR TK XFR....................MAN
  T TANK FEED (if not empty)....................AUTO
  T TANK MODE (if not empty)....................FWD

  - **When Trim Tank empty:**

AVOID NEGATIVE G FACTOR
MAX ALTITUDE: GRAVITY FEED CEILING

- *20 000 ft if flight time from takeoff > 30 min*
- *15 000 ft if flight time from takeoff < 30 min*
- *10 000 ft for JP4 or JET B if flight time from takeoff < 30 min*

- **When reaching gravity feed ceiling:**
  WING X FEED....................CLOSE

  Crossfeed valve closes, except in EMER ELEC configuration.

INR UNUSABLE IF < 2 000 kg (4 400 lb)

2 000 kg (4 400 lb) of fuel per affected tank cannot be used by gravity.

[QRH] GRAVITY FUEL FEEDING

Ident.: PRO-ABN-FUEL-00011241.0006001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

ENG START selector.......................................IGN
AVOID NEGATIVE G FACTOR
MAX ALTITUDE: GRAVITY FEED CEILING

- *20 000 ft if flight time from takeoff > 30 min*
- *15 000 ft if flight time from takeoff < 30 min*
- *7 000 ft for JP4 or JET B if flight time from takeoff < 30 min*

● **When reaching gravity feed ceiling:**

WING X FEED.......................................CLOSE

Crossfeed valve closes, except in EMER ELEC configuration.

INR UNUSABLE IF < 2 000 kg (4 400 lb)

2 000 kg (4 400 lb) of fuel per affected tank cannot be used by gravity.

[QRH] TRIM TANK FUEL UNUSABLE

Ident.: PRO-ABN-FUEL-00011326.0004001 / 17 MAR 17
Applicable to: ALL

T TANK MODE..........FWD
T TANK FEED..........OPEN

- **If TRIM TANK FUEL unusable:**

  OUTR TK XFR.......... ON

  The CG moves forward

  L CTR TK PUMP..........OFF
  R CTR TK PUMP.......... OFF

  If the center tank is not yet empty, maintain fuel in the aircraft's center tank by switching off the pumps. This will reduce the effect of unusable trim tank fuel on the aircraft's center of gravity.

  MAXIMUM FLIGHT TIME: 4 HOURS

  After 4 h, depending on the fuel distribution, the aft CG limit may be reached.

- **If CG > aft CG limit shown below, at landing:**

  APPR SPD: VLS +10 kt
  LDG DIST PROC.......... APPLY

  FOR ROLLOUT: APPLY CONTINUOUS MANUAL BRAKING

FUEL FUEL LO TEMP (Cont'd)

Ident.: PRO-ABN-FUEL-AI-00019076.0001001 / 21 MAR 17

L2 Regardless of the fuel type, the flight crew may consider delaying application of the rest of procedure, until reaching the minimum fuel temperature specific to their fuel type (*Refer to LIM-FUEL Fuel Temperature*).

L1 FUEL FREEZE PT...CHECK

- ■ **On ground, before takeoff:**
  - ● **IF JET A FUEL (not displayed at -44 °C (inner tank temp), or -47 °C (outer or trim tank temp)):**

    DELAY T.O.

    L2 *Do not takeoff until the temperature is within limits.*

- L1 ■ **In flight:**
  - ● **If inner tank temperature is less than -37 °C (auto recall at -44 °C):**
    - ● **IF JET A FUEL (not displayed at -44 °C):**

      CTR TANK XFR...MAN
  - ● **If outer tank temperature is less than -40 °C (auto recall at -47 °C):**
    - ● **IF JET A FUEL (not displayed at -47 °C):**

      OUTR TK XFR.. ON

      L2 *If the center tank is not empty, the center tank pumps must be selected OFF to avoid inadvertent fuel transfer from center to outer tanks*
  - L1 ● **If trim tank temperature is less than -40 °C (auto recall at -47 °C):**
    - ● **IF JET A FUEL (not displayed at -47 °C):**

      T TANK MODE..FWD

      L2 *Note: If trim tank pump fails, or is not installed, this part of the procedure is replaced by:*

      - ● ***WHEN SPD > 270 KT AND NOT IN CLIMB:***

        T TANK MODE...FWD

      If the CG is forward 26 % MAC, the CG should be monitored during the forward transfer, to ensure that forward CG limits are not exceeded.

      Fuel consumption increases by approximately 1 %.

FUEL T TANK XFR FAULT (Cont'd)

Ident.: PRO-ABN-FUEL-Y-00019158.0003001 / 21 MAR 16

T TANK MODE.....FWD

L2 *Displayed in all other cases.*

L1 T TANK FEED.....OPEN

L2 *Fuel consumption is increased by approximately 1 %.*
Displayed if the trim tank isolation valve is failed closed or if the trim tank low level sensor is failed.

Note:
1. *If the trim tank pump is failed or not installed, the above procedure is preceded by: WHEN SPD > 270 kt AND NOT IN CLIMB:*
2. *If forward transfer is initiated by T TANK FEED sw, do not completely empty the trim tank (below around 200 kg). This avoids drainage of the trim line and so ensures APU supply.*

L1 ● **If either aft transfer valve is failed open:**

FUEL IMBALANCE.....MONITOR

● **IF TRIM TK QUANTITY NOT DECREASING:**

T TANK MODE.....AUTO
T TANK FEED.....ISOL
T TK FUEL UNUSABLE

L2 *These steps prevent unwanted aft transfer via a failed aft transfer valve.*

L1 ● **If CG is forward of 32 %:**

L2 Trim tank transfer has to be done in two steps.

L1 ● **WHEN T TANK < 2.4 T:**

T TANK MODE.....AUTO

L2 *Displayed in all other cases.*

L1 T TANK FEED.....AUTO

L2 *Displayed if the trim tank isolation valve is failed closed or if the trim tank low level sensor is failed.*
This stops the transfer after the first step.

L1 ● **WHEN CTR TANK EMPTY:**

T TANK MODE.....FWD

L2 *Displayed in all other cases.*

L1 T TANK FEED.....OPEN

LAND ASAP

RAT..MAN ON

L2 *"RAT MAN ON" is only triggered, on the ECAM in case of G + Y hydraulic system low level.*

L1 CONSIDER RAT MAN USE

L2 *"CONSIDER RAT MAN USE" is not triggered, in case of a green reservoir overheat, or in case of a green hydraulic system low level.*

Note: With RAT extended, the green system is recovered. This permits to recover the flap extensions. However, green pressure will be lost when the speed will drop below 140 kt. At the time, the red warning "G + Y SYS LO PR" will be triggered again. With RAT extended, the fuel consumption is approximately increased by 1 %.

L1 ● **If "RAT .... MAN ON" or "CONSIDER RAT MAN USE" action lines are displayed:**

MIN RAT SPEED..140 KT

AFFECTED PUMPS..OFF
SPD BRK..DO NOT USE

L2 *Due to the loss of one elevator.*

L1 MAX FL.. REFER TO THE TABLE BELOW

[QRH] LANDING WITH ABNORMAL L/G

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT, LV-KHU

Ident.: PRO-ABN-LG-K-00019095.0005001 / 17 MAR 17

The procedure is intended for use when nose or main landing gear fail to extend or/and lockdown following the application of L/G GRVTY EXTN procedure.
It is preferable to use any available landing gear rather than carry out a belly landing.
Under these circumstances, a hard surface runway landing is recommended.
Full advantage should be taken of any foam spread on the runway

CAUTION	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible GPWS "TOO LOW GEAR" aural alert.

Ident.: PRO-ABN-LG-K-00019096.0003001 / 05 MAR 19

CABIN CREW .... NOTIFY

Notify the cabin crew of the nature of emergency encountered and state intention. Specify the amount of time available for preparation.

ATC.. NOTIFY

Notify ATC of the nature of emergency and state intentions.

- **If NOSE L/G abnormal:**

  CONSIDER CG AFT SHIFT

  10 pax from front to rear move the CG roughly +2 % aft.

- **If one MAIN L/G abnormal:**

  FUEL DISTRIBUTION.. CONSIDER

  Open all fuel X-FEED valves and switch off the pumps on the side with landing gear normally extended.

OXYGEN CREW SUPPLY.. OFF
SIGNS.. ON
CABIN and COCKPIT (LOOSE EQPT).. PREPARE

Continued on the following page

[QRH] LANDING WITH ABNORMAL L/G (Cont'd)

Ident.: PRO-ABN-LG-K-00019097.0005001 / 17 MAR 17

- **For approach:**

  GPWS SYS .... OFF
  L/G lever .... CHECK DOWN
  LDG GEAR GRVTY EXTN .... RESET

  DO NOT ARM AUTOBRAKE

  Manual braking will enable better pitch and roll control. Moreover, with at least one main landing gear in the abnormal position the autobrake cannot be activated (ground spoilers not armed)

  EMER EXIT LT .... ON
  COMMERCIAL .... OFF
  CABIN REPORT .... OBTAIN
  JETTISON ◁✻ .... OFF
  T TANK FEED .... ISOL
  A/SKID & N/W STRG .... OFF

  With one main landing gear not extended, the reference speed used by the anti-skid to detect a wheel blockage is not correctly initialized. As a result, the anti-skid must be switched off to prevent permanent brake release.

  MAX BRAKE PR : 1 000 PSI

  Modulate the brake pressure to 1 000 PSI because the anti-skid is off.

  - **If one or both MAIN L/G abnormal:** DO NOT ARM GROUND SPOILERS

    To keep as much roll authority as possible for maintaining the wings level. Ground spoiler extension would prevent spoilers from acting as roll surfaces.

RAM AIR .... ON

To ensure full depressurization of the aircraft before impact.

- **At 500 ft AGL:**

  BRACE FOR IMPACT .... ORDER

Continued on the following page

[QRH] LANDING WITH ABNORMAL L/G (Cont'd)

Ident.: PRO-ABN-LG-K-00019099.0001001 / 17 MAR 17

- **At flare, touchdown and rollout:**

  Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls. Engine pumps continue to supply adequate hydraulic pressure for 30 s after engine shutdown.

  DO NOT USE REVERSE

  Do not use reversers in order to prevent:
  - *The engine(s) from touching the ground during rollout*
  - *Ground spoilers extension, in the case of abnormal main landing gear.*

  - **If NOSE L/G abnormal:**

    KEEP NOSE UP

    After touchdown, keep the nose off the runway by using the elevator. Then, lower the nose onto the runway before elevator control is lost.

    BRAKES.. SMOOTHLY APPLY

    Adapt braking to the efficiency of the elevator.

    BEFORE NOSE IMPACT : ALL ENG MASTERS OFF

    Shut down the engines before nose impact.

  - **If one MAIN L/G abnormal:**

    AT TOUCHDOWN : ALL ENG MASTERS OFF (in sequence)

    After main gear touchdown, shut down the engine on the failure side first, then the other engine before nacelle touchdown.

    KEEP AFFECTED SIDE WING UP

    Use roll control, as needed, to keep unsupported wing up as long as possible.

  - **If both MAIN L/G abnormal:**

    DURING FLARE : ALL ENG MASTERS OFF

    MIN PITCH ATT : 6 °

Continued on the following page

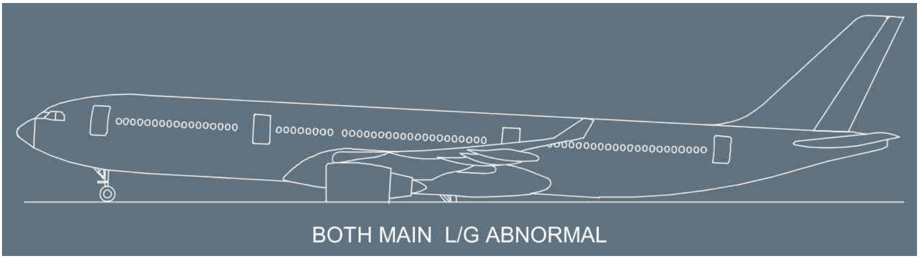
ONE MAIN L/G ABNORMAL



BOTH MAIN L/G ABNORMAL

[QRH] L/G GRAVITY EXTENSION

Ident.: PRO-ABN-LG-00015204.0001001 / 12 MAY 23
Applicable to: ALL

CAUTION	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible GPWS "TOO LOW GEAR" aural alert.

MAX SPEED....................200 KT

Speed with main landing gear doors open is limited to 200 kt to avoid vibrations transmitted through the cabin floor.

LDG GRVTY EXTN....................DOWN

● **When L/G DOWNLOCKED**

L/G lever....................DOWN

The landing gear lever should be confirmed in the DOWN position for the following reasons:
- *To extinguish the UNLK lights on landing gear indications panel.*
- *To prevent the L/G CTL message on WHEEL SD page and the L/G GEAR NOT DOWN alert on the ECAM.*
- *To minimize the risk of landing gear retraction on the ground, due to unknown system fault, when the freefall system is reset.*

GEAR DOWN indications....................CHECK

N/W STEERING NOT AVAILABLE

L/G DOORS REMAIN OPEN

■ **If successful:**

DO NOT RESET LDG GEAR GRVTY EXTN

The freefall system should not be reset to avoid undesirable effect such as further fluid loss in the event of a leak or possible landing gear unlocking in the event of a gear selector valve jammed in UP position.

Note: *Following the use of the freefall system for training purposes in flight, the system can be reset in flight. Provided that the green hydraulic system is available, a reset of the freefall system enables closure of the landing gear doors.*

■ **If unsuccessful:**

LDG WITH ABNORMAL L/G PROC....................APPLY

Refer to QRH/ABN-21 Landing with Abnormal L/G

Continued on the following page

[QRH] L/G GRAVITY EXTENSION (Cont'd)

Note: 1. *One gravity extension reset is allowed in case of L/G GEAR NOT DOWNLOCKED alert display.*
2. *In all cases the freefall system should not be reset by flight crew on the ground following freefall extension.*

NWS OVERSTEER

L2 When the landing gear lever is down, check that at least one green triangle is displayed on each landing gear on the WHEEL SD page. This confirms that the landing gear is downlocked. Rely also on the "LDG GEAR DN" green LDG MEMO message to confirm that the landing gear is downlocked.
The GPWS "TOO LOW GEAR" aural alert could be therefore wrongly triggered during the approach.

L1 Crew awareness.

  ENG START SEL.......IGN
  ATC.......NOTIFY

  Notify ATC of the nature of the emergency, and state intention. The flight crew can communicate with the ATC using voice, or CPDLC when the voice contact cannot be established or has poor quality.

  EMER DESCENT (PA).......ANNOUNCE

  The flight crew must inform the cabin of emergency descent on the PA system.

  ATC XPDR 7700.......CONSIDER

  Squawk 7700 unless otherwise specified by ATC.

  CREW OXY MASKS DILUTION.......NORM

  - *To save oxygen, set the oxygen diluter selector to the N position*
  - *If the oxygen diluter selector remains set to 100 %, oxygen quantity may be insufficient to cover the entire emergency descent profile*
  - *Ensure that crew communication is established with oxygen masks. Avoid the continuous use of the interphone to minimize interference with the breathing noise in the oxygen mask.*

  MAX FL : 100 / MEA - MORA

  - **If CAB ALT above 14 000 ft:**
    OXYGEN PAX MASK MAN ON.......PRESS

    This action confirms that the passenger oxygen masks are released.

Continued on the following page

[MEM] EMER DESCENT (Cont'd)

Note: *Notify the cabin crew, when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

[MEM] STALL RECOVERY

Ident.: PRO-ABN-MISC-00013664.0001001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

NOSE DOWN PITCH CONTROL....................APPLY

This will reduce angle of attack

Note: *In case of lack of pitch down authority, reducing thrust may be necessary.*

BANK....................WINGS LEVEL

- **When out of stall (no longer stall indications) :**

  THRUST....................INCREASE SMOOTHLY AS NEEDED

  Note: *In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.*

  SPEEDBRAKES....................CHECK RETRACTED
  FLIGHT PATH....................RECOVER SMOOTHLY

  - **If in clean configuration and below 20 000 ft :**

    FLAP1....................SELECT

    Note: *If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.*

[MEM] STALL RECOVERY

Ident.: PRO-ABN-MISC-00013664.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

As soon as any stall indication (could be aural warning, "STALL STALL" red message on PFD, buffet...) is recognized, apply the immediate actions:

NOSE DOWN PITCH CONTROL..APPLY

This will reduce angle of attack

Note: *In case of lack of pitch down authority, reducing thrust may be necessary.*

BANK..WINGS LEVEL

- **When out of stall (no longer stall indications) :**

  THRUST..INCREASE SMOOTHLY AS NEEDED

  Note: *In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.*

  SPEEDBRAKES..CHECK RETRACTED
  FLIGHT PATH..RECOVER SMOOTHLY

  - **If in clean configuration and below 20 000 ft :**

    FLAP1..SELECT

    Note: *If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.*

[MEM] STALL WARNING AT LIFTOFF

Ident.: PRO-ABN-MISC-00013665.0002001 / 10 MAY 21
Applicable to: ALL

If stall warnings trigger at liftoff, apply the following immediate actions:

THRUST..TOGA

At the same time:

PITCH ATTITUDE..15 °
BANK..WINGS LEVEL

[QRH] BOMB ON BOARD

Ident.: PRO-ABN-MISC-00012264.0003001 / 05 MAY 22
Applicable to: ALL

COCKPIT PROCEDURES

BACKGROUND

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.
To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.
These conditions are achieved by using the manual pressure control.

PROCEDURE

The following procedure assumes that it is initiated during climb or cruise:

First, maintain the cabin altitude using manual pressure mode.
While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI.
During further steps of descent, maintain delta P at 1 PSI using the cabin V/S target selector.
During the approach, use automatic pressure mode in order to reduce the differential pressure to zero at touchdown.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

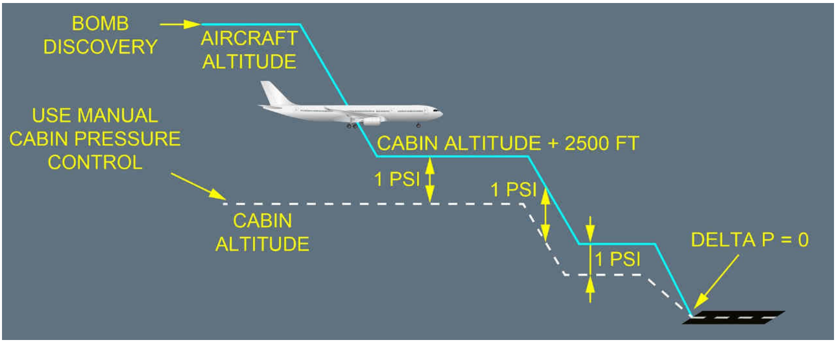
CKPT/CAB COM..ESTABLISH

■ **If landing and evacuation possible within 30 min:**
  ATC/COMPANY.. NOTIFY
  EVAC...PREPARE

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

■ If landing and evacuation NOT possible within 30 min:



AIRCRAFT (IF CLIMBING)..LEVEL OFF

CABIN PRESS MODE SEL..MAN

L2 *The purpose is to immediately prevent the cabin altitude from increasing, in order to avoid the activation of an altitude-sensitive bomb.*

L1 MAINTAIN CAB ALT

L2 *Use MAN V/S CTL sw to maintain the cabin altitude at the value it had when the bomb was discovered.*

L1 ATC/COMPANY..NOTIFY

L2 *To obtain expert advice from explosive specialists.*

L1 TRGT SPEED : PREFER LO IAS

Low speed could reduce the consequences of possible structural damage, if the bomb explodes.

DESCENT TO CAB ALT + 2 500 ft or MEA - MORA..INITIATE

L2 *Descending to 2 500 ft above the cabin altitude gives a cabin differential pressure of approximately 1 PSI, which helps to ensure that the blast goes outwards, if the bomb explodes.*

L1 AVOID SHARP MANEUVERS

L2 *Which might result in the bomb moving.*

L1 MAINTAIN CAB ALT

L2 *Use MAN V/S CTL sw to maintain the cabin altitude. Initially brief UP input should be required; but, be careful not to increase the cabin altitude.*

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

L1 ● **When at CAB ALT + 2 500 ft:**

MAINTAIN 1 PSI ΔP

L2 *Use MAN V/S CTL sw to adjust delta P to 1 PSI. Brief DN input should be initially required to set 0 ft/min cabin vertical speed.*

L1 GALLEY....................OFF

FUEL RESERVES....................DETERMINE

When flying at cabin altitude + 2 500 ft, the fuel consumption in CONF 1, with landing gear down, is about 2.1 times that consumed in clean configuration.

● **When bomb secured at the LRBL or cannot be moved:**

Least Risk Bomb Location (LRBL) is the center of the RH aft cabin door.

EMER EXIT LT....................ON

L2 *To recover minimum cabin lighting when the COMMERCIAL pb is OFF*

L1 COMMERCIAL....................OFF

● **If fuel permits:**

FLAPS....................AT LEAST CONF 1

L/G lever (except for flight over water)....................DOWN

L2 *The detonation could damage the landing systems. Therefore, if fuel permits, configure the aircraft for landing as soon as possible. Reducing the speed will minimize stress on the aircraft structure.*

L1 USE NORMAL CONF FOR LANDING

DURING FURTHER DESCENT: MAINTAIN MAX 1 PSI ΔP

L2 *Use MAN V/S CTL sw to DN to adjust delta P to 1 PSI.*

L1 ● **During approach:**

CABIN PRESS MODE SEL....................AUTO

L2 *This allows CPC to automatically control the cabin altitude to 0 during final approach.*

L1 ● **When aircraft on ground and stopped in a remote area (if possible):**

Refer to QRH/ABN-22 EMER EVAC.

CABIN PROCEDURES

If a suspect device is found in the cabin:

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

WARNING	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.

WARNING	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.

CAUTION	The least risk bomb location for the aircraft structure and systems is center of the RH aft cabin door.

EOD PERSONNEL ON BOARD....................CHECK

L2 *Announce: “Is there any EOD personnel on board ?”. By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

L1 DO NOT OPEN THE BOMB
DO NOT CUT BOMB’S WIRES
SECURE BOMB AGAINST SLIPPING
PROTECT BOMB AGAINST SHOCKS

Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.

PASSENGERS.................... LEAD AWAY FROM BOMB

L2 *Move passengers at least 4 seat rows away from the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*
Passengers near the bomb should protect their heads with pillows, blankets.
All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables should be in their full upright position.
Service items may need to be collected in order to secure tray tables.

L1 CREW REST AREAS.................... EVACUATE

L2 *For aircraft equipped with crew rest areas (FCRC, LDMCR, BCRC).*

L1 PORTABLE ELECTRONIC DEVICES....................SWITCH OFF

L2 *The cabin crews must command passengers to switch off all portable electronic devices.*

L1 BOMB....................CHECK NO ANTI-LIFT DEVICE

L2 *To check for an anti-lift switch or lever, slide a string or stiff card, (such as the emergency information card) under the bomb, without disturbing the bomb.*
If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.
If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e. g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.

L1 EMERGENCY EQUIPMENT....................REMOVE AND STOW

L2 *Emergency equipment (PBE, fire extinguisher, etc.) located close to the LRBL must be removed and stowed in alternate location.*

L1 GALLEY/IFE POWER....................OFF

L2 *All galley and IFE equipment located close to the LRBL must be switched off.*

L1 ● **If the bomb can be moved:**

RH AFT CABIN DOOR SLIDE....................DISARM
LEAST RISK BOMB LOCATION (LRBL)....................PREPARE

L2 *Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*
On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.
Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.

CAUTION	*DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.*

L1 BOMB INDICATION LINE....................POSITION

Note: *A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m) line (e.g. neckties, headset cord, or belts connected together) preferably of constrating color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.

BOMB....................MOVE TO LRBL

L2 *Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

CAUTION	*Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.*

L1 LEAST RISK BOMB LOCATION (LRBL)..COMPLETE

L2 *Place an additional single thin sheet of plastic over the bomb.*

CAUTION	*DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.*

L1 Build up at 25 cm (10 in) of wetted material around the sides and on top of the bomb.

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

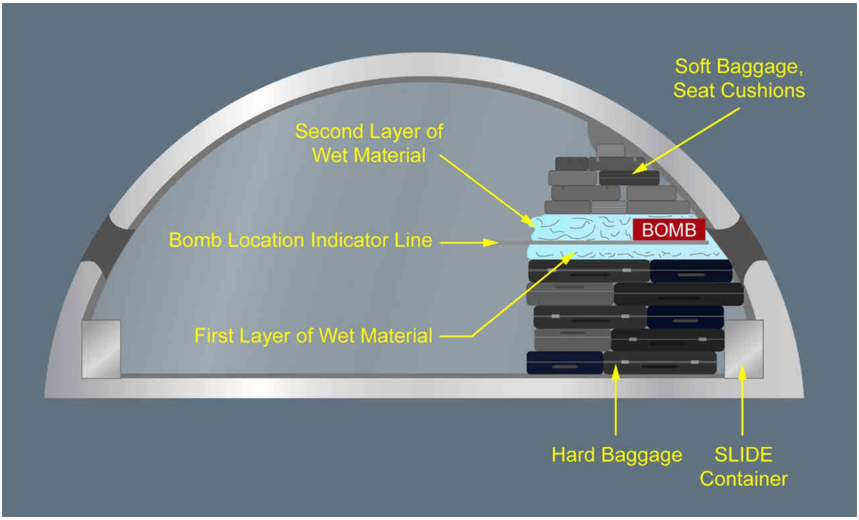
L2 *The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.*
Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water or any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

L1 USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

LRBL STACK



Soft Baggage, Seat Cushions
Second Layer of Wet Material
Bomb Location Indicator Line
BOMB
First Layer of Wet Material
Hard Baggage
SLIDE Container

PASSENGERS.. MOVE/ADVISE

L2 *Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.

L1 CABIN CREW.. NOTIFY COCKPIT CREW

L2 *Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

L1 EVACUATION/DISEMBARKATION.. EXECUTE

L2 *Evacuate through normal and emergency exits on the opposite of the "bomb" location. Do not use the door just opposite the "bomb".*

Use all available airport facilities to disembark without delay.

[QRH] COCKPIT WINDSHIELD / WINDOW ARCING

Ident.: PRO-ABN-MISC-00012266.0001001 / 20 MAR 17

Applicable to: ALL

Affected WINDSHIELD / WINDOW WHC reset button..PULL

In case of electrical arcing, pull the Window Heat Computer reset button that is located on the affected side.

- *Burning smell or smoke identified as coming from the bottom left corner of CAPT windshield or bottom right corner of the F/O windshield.*
- *WINDSHIELD/WINDOW LEFT SIDE - WHC 1 C/B (261 VU)*
- *WINDSHIELD/WINDOW RIGHT SIDE - WHC 2 C/B (262 VU).*

[QRH] COCKPIT WINDSHIELD / WINDOW CRACKED

Ident.: PRO-ABN-MISC-00012265.0001001 / 05 MAY 22
Applicable to: ALL

SHOULDER HARNESS...FASTEN
TOUCH THE CRACK WITH A PEN (OR CAREFULLY WITH FINGERNAIL)

- **If no crack on cockpit side:**

  NO LIMITATION

  The inner ply is not affected. Therefore, the window/windshield is still able to sustain the differential pressure up to the maximum flight level.

- **If cracks on cockpit side:**

  CREW OXY MASKS...USE

  MAX FL : 230 / MEA-MORA

  The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. Descend to FL 230/MEA-MORA and reduce differential pressure to 5 PSI.

  Note: *The maximum flight level is restricted to FL 230/MEA-MORA to obtain ΔP 5 PSI, without resulting in an excessive cabin altitude and an CAB PR EXCESS CAB ALTalert.*

  The following procedure enables maintaining ΔP 5 PSI in manual cabin pressure mode:

  CAB PRESS MODE SEL...MAN

  DISREGARD THE CAB ALT TARGET TABLE DISPLAYED ON THE ECAM
  MAN V/S CTL...AS RQRD

  SET THE CABIN ALTITUDE ACCORDING TO THE TABLE BELOW TO MAINTAIN ΔP 5 PSI

ΔP = 5 PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

  - **When ΔP is 5 PSI:**

    CREW OXY MASKS...REMOVE

  - **Below FL 100:**

    CAB PRESS MODE SEL...AUTO

Note: *Due to the increased noise level, pay particular attention to visual warnings.*

- **If visibility not sufficient for approach due to damage:**

  CONSIDER AUTOLAND

Continued on the following page

[QRH] COCKPIT WINDSHIELD / WINDOW CRACKED (Cont'd)

- **For approach, if AUTOLAND not available:**

  CAB PRESS MODE SEL.......................................MAN
  MAN V/S CTL.......................................FULL UP

  MAX SPEED : 230 kt
  PF SLIDING WINDOW.......................................OPEN

  DITCHING pb ....ON

Continued on the following page

[QRH] DITCHING (Cont'd)

L2 *The direction of ditching depends mainly on wind direction and sea state and these factors may be considered as follows:*

1. Wind direction:

This may be determined by observation of the waves, which move and break downwind. Spray from wave tops is also a reliable indicator.

2. Wind speed:

The following guidelines can be used to evaluate wind speed:

A few white crests	:	*8-17 kt*
Many white crests	:	*17-26 kt*
Streaks of foam along water	:	*23-35 kt*
Spray from waves	:	*35-43 kt*

3. Sea state:

This is best determined from a height of 500 ft to 1 000 ft. At lower height, the direction of the swell may be less obvious than the direction of the waves, even though the waves are much smaller.

When there is no swell, align into the wind. In the presence of swell, and provided that drift does not exceed 10 °, ditch parallel to the swell and as nearly into the wind as possible. If drift exceeds 10 °, ditch into wind. The presence of drift on touchdown is not dangerous, but every effort should be made to minimize roll.

[QRH] OVERWEIGHT LANDING

Ident.: PRO-ABN-MISC-00023459.0012001 / 17 NOV 20
Applicable to: ALL

CONSIDER JETTISON ◁
USE CONF FULL FOR LANDING UNLESS SPECIFIED BY ABN PROC OR LIMITED BY LANDING PERF
LDG DIST PROC..APPLY

- **For approach:**
  PACK 1+2....................................OFF OR SUPPLIED BY APU

  L2 *The selection of the PACKS to OFF (or to APU BLEED) increases the maximum thrust available from the engines, in the case of a go-around.*

  L1
  - **If landing CONF other than FULL:** USE CONF 1+F FOR GO AROUND

  SPEED AT RUNWAY THRESHOLD: VLS

  L2 *This speed target is applicable in manual landing and autoland. Reduce the speed to reach VLS at the runway threshold.*

  L1 MINIMIZE V/S AT TOUCHDOWN

  L2 *Touch down as smoothly as possible to reduce the V/S. The maximum touchdown V/S should not exceed 360 ft/min. The main landing gears must touch down as symmetrically as possible.*

L1
- **For landing:**
  INCREASE FLARE HEIGHT

  USE MAX REVERSE ASAP

  L2 *It is recommended to use the reverse as soon as possible, in order to limit the braking action.*

  L1
  - **After nosewheel touchdown:** APPLY BRAKES AS NECESSARY

    L2 *It is recommended that the flight crew uses the maximum available runway length to limit the braking energy.*

L1
- **When landing completed:**
  BRAKE FANS ◁ ....ON

  L2 *Be prepared for tire deflation, if temperatures exceed 800 °C.*

[QRH] SEVERE TURBULENCE

Ident.: PRO-ABN-MISC-10-00002018.0001001 / 17 MAR 17
Applicable to: ALL

When possible, the flight crew should plan to fly above or around areas of severe turbulence. If turbulence is unavoidable, aim to keep the speed in the region of the target speed given in this section, so as to provide the best protection against the effect of gust on the aircraft structure, whilst maintaining an adequate margin above VLS.
Sufficient buffet margin exists at optimum altitude. In order to further increase the margin to buffet onset, consider descending to a lower altitude.
Severe turbulence is defined as turbulence that causes large, abrupt changes in altitude and/or attitude. It usually causes large variations in airspeed.
Occupants are forced violently against their seat belts and loose objects will move around the aircraft.
If severe turbulence occurs during a flight, the flight crew must make a logbook entry in order to initiate maintenance action.

Note: *Recommendations for severe turbulence are also applicable to extreme turbulence.*

Ident.: PRO-ABN-MISC-10-00002019.0002001 / 23 NOV 16
Applicable to: ALL

Before the aircraft enters an area where turbulence is expected:
- All loose equipment must be secured in the cockpit and in the cabin
- The flight crew must set the SEAT BELTS sw to ON.

Ident.: PRO-ABN-MISC-10-00002020.0001001 / 10 DEC 09
Applicable to: ALL

Keep the autopilot ON.
When thrust changes are excessive : Disconnect autothrust.
For approach : Use autothrust for managed speed.

Ident.: PRO-ABN-MISC-10-00002021.0005001 / 16 MAR 11
Applicable to: ALL

Set the thrust to give the recommended speed (*Refer to PRO-ABN-MISC [QRH] Thrust Setting For Recommended Speed*) . This thrust setting aims to obtain, in stabilized conditions, the speed for turbulence penetration given in the graph below.
Change thrust only in case of an extreme variation in airspeed, and do not chase your Mach or airspeed.
A transient increase is preferable to a loss of speed that decreases buffet margins and is difficult to recover.

IFP-V11.3 A330-243

Ident.: PRO-ABN-MISC-10-00006027.0001001 / 09 JUN 15
Applicable to: ALL

If the flight crew flies the aircraft manually:
- The flight crew may expect large variations in altitude, but should not chase altitude
- The flight crew should consider descending to or below the OPT FL, in order to increase the margin to buffet.

[QRH] TAILSTRIKE

Ident.: PRO-ABN-MISC-00012303.0001001 / 04 JUN 19
Applicable to: ALL

LAND ASAP

MAX FL : 100 / MEA-MORA

Limit to FL 100 or to MEA or MORA to minimize structural stress.
Return to the airport for damage assessment.

[QRH] VOLCANIC ASH ENCOUNTER

Ident.: PRO-ABN-MISC-00012302.0006001 / 05 JUN 18
Applicable to: ALL

180 ° TURN.. INITIATE

The performance of a 180 ° turn will usually enable the aircraft to exit the volcanic ash clouds as quickly as possible, because volcanic ash clouds can extend for hundreds of nautical miles.

ATC.. NOTIFY

Note: *Electrostatic conditions may cause communication problems.*

A/THR.. OFF

This prevents autothrust from generating thrust variations.

THRUST (IF COND PERMIT).. REDUCE

Reduced thrust minimizes ash ingestion.
If altitude permits, reduce thrust to idle. This maximizes the engine surge margin, and lowers engine turbine temperature.

CREW OXY MASKS.. USE / 100 % / EMER
CABIN CREW.. NOTIFY
OXYGEN PASSENGER MASK MAN ON.. AS RQRD

Depending on contamination.

ENG ANTI ICE.. ON
WING ANTI ICE.. ON
PACK FLOW.. HI

Maximum air bleed gives the engines additional stall margin.

CARGO ISOL VALVES.. OFF

Note: *To prevent a cargo smoke warning being triggered.*

ENGINE PARAMETERS.. MONITOR

Monitor EGT, in particular. If the EGT exceeds limits, it may become necessary to consider a precautionary engine shutdown and engine restart in flight.

Note: *In the case of precautionary shutdown:*

- *Restart when clear of the volcanic ash cloud*
- *Upon restart, the engine may accelerate very slowly. Do not misinterpret this as a failure to start.*

Continued on the following page

[QRH] VOLCANIC ASH ENCOUNTER (Cont'd)

- *Consider that the compressor and turbine blades have been eroded and avoid sudden changes in thrust. Fuel flow and EGT may increase.*

AIRSPEED INDICATIONS...MONITOR

If airspeed is unreliable or lost, Refer to PRO-ABN-NAV Unreliable Speed Indication - Memory Items.

Note: *If all engines flame out and speed indications are lost, Refer to ALL ENGINES FAILURE procedure to get the required pitch attitude for the optimum relight speed.*
In case of engine failure, switch off the wing anti ice before engine restart.

- **If visibility not sufficient for approach due to windshield damage:**

  CONSIDER AUTOLAND

  - **For approach, if AUTOLAND not available:**

    CAB PRESS MODE SEL...MAN
    MAN V/S CTL...FULL UP

    Due to the increased noise level, pay particular attention to visual warnings.

    MAX SPEED : 230 kt
    PF SLIDING WINDOW...OPEN

	100	**8°** (280 kt)	**9°** (265 kt)	**12°** (225 kt)	**13°** (235 kt)
	200	**6°** (290 kt)	**7°** (265 kt)	**9°** (230 kt)	**10°** (225 kt)
	300	**5°** (270 kt)	**5°** (265 kt)	**6°** (240 kt)	**7°** (220 kt)
	400	/	/	**4°** (235 kt)	**5°** (205 kt)

CRUISE

FLYING TECHNIQUE TO STABILIZE SPEED

Stabilize the altitude. When altitude is stabilized:

- If the pitch is above the target pitch, increase the thrust and maintain the altitude.
- If the pitch is below the target pitch, decrease the thrust and maintain the altitude.

When the pitch reaches the target pitch, adjust the thrust to keep this target pitch.

LEVEL FLIGHT IN CLEAN CONFIGURATION					
		240 t 530 000 lb	200 t 440 000 lb	160 t 350 000 lb	120 t 260 000 lb
PITCH	**FL**	**THRUST % N1 (Resultant speed)**			
4° at or below FL250	**100**	**61%** (280 kt)	**57%** (255 kt)	**52%** (225 kt)	**47%** (195 kt)
	200	**68%** (280 kt)	**64%** (255 kt)	**59%** (225 kt)	**57%** (195 kt)
	250	**71%** (275 kt)	**67%** (250 kt)	**62%** (225 kt)	**56%** (195 kt)
3° above FL250	**300**	**76%** (300 kt)	**72%** (275 kt)	**67%** (245 kt)	**61%** (210 kt)
	350	/	**76%** (265 kt)	**71%** (240 kt)	**65%** (210 kt)
	400	/	/	**75%** (235 kt)	**69%** (205 kt)

Note: *If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 3% in cruise and 1.5% in approach.*
Fuel flow will increase by about 10%.

STATUS

On the ECAM, only one of the following two statements is displayed, depending on the autopilot status.
Use manual pitch trim when flare law is active.

- **WHEN L/G DN:**
  MAN PITCH TRIM.. USE
  Provided the autopilot is off, switching to flare law occurs at landing gear extension.
- **WHEN L/G DN AND AP OFF:**
  MAN PITCH TRIM.. USE
  When the autopilot is engaged, and the landing gear is extended, switching to flare law occurs at autopilot disengagement.

ILS APPR mode cannot be engaged, LOC mode is available via the FCU LOC pb.

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: LV-GKO, LV-GKP

Ident.: PRO-ABN-SMOKE-L-00011660.0001001 / 09 NOV 21

This procedure includes all the steps of the SMOKE AVNCS VENT SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment.
- Requested by the SMOKE AVNCS VENT SMOKE procedure
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other SMOKE ECAM alert triggers (e.g. CARGO), the flight crew must first apply the ECAM procedure and then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the immediate actions that the flight crew must perform, if smoke/fumes are detected (with or without ECAM activation, and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In parallel, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the AT ANY TIME Items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

APPLY IMMEDIATELY

CREW OXY MASKS (if required)..USE / 100% / EMERG

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke/fumes from the mask.

VENTILATION EXTRACT.......OVRD

Avionics ventilation air is extracted overboard.

CAB FANS.......OFF

To prevent smoke/fumes from entering the cockpit and cabin.

GALLEY.......OFF
SIGNS.......ON
CKPT / CABIN COM.......ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

● **If smoke/fumes source immediately obvious, accessible and extinguishable:**
FAULTY EQT.......ISOLATE

● **If smoke/fumes source not immediately isolated:**
DIVERSION.......INITIATE
DESCENT TO FL 100 / MEA-MORA.......INITIATE

● **At ANY TIME of the procedure, if smoke/fumes become the GREATEST THREAT:**
REMOVAL OF SMOKE / FUMES.......CONSIDER

When necessary, the smoke/fumes removal procedure must be applied before the electrical emergency configuration is set. Indeed, in electrical emergency configuration, smoke/fumes removal cannot be performed.
Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES.

ELEC EMER CONFIG.......CONSIDER

Refer to the end of the procedure to set ELEC EMER CONFIG.

● **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
IMMEDIATE LANDING.......CONSIDER

Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.

Guidelines to determine smoke/fumes source:

- If smoke/fumes initially come out of the cockpit's ventilation outlets, or if smoke/fumes are detected in the cabin, the flight crew may suspect an AIR COND SMOKE. In addition, very

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

shortly thereafter, several other SMOKE ECAM alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must therefore be applied.

- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceptible in the cockpit and/or cabin. In that case, it will be re-circulated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the SMOKE AVNCS VENT SMOKE alert is triggered, the flight crew may suspect avionics smoke/fumes
- If smoke/fumes are detected, while an equipment is declared faulty, the flight crew may suspect that smoke/fumes are coming from this equipment.

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

TO SET ELEC EMER CONFIG

EMER ELEC PWR....................MAN ON

- **When EMER GEN is available:**

  GEN 1....................OFF
  GEN 2....................OFF
  APU GEN....................OFF

ASSOCIATED PROCEDURES

ELEC EMER CONFIG

Two different procedures can be displayed on the ECAM, depending on whether the SMOKE AVNCS VENT SMOKE alert is triggered or not before the flight crew sets the electrical emergency configuration.

- **If SMOKE AVNCS VENT SMOKE not triggered:**

  APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

  - **At 3 min before landing or 2 000 ft AAL:**

    Restore all generators 3 min before landing or at 2 000 ft AAL to recover normal braking and normal flight control law, while minimizing possible reactivation of a smoke source. Just before restoring all generators, switch F/O side on IR 3, since:
    - IR 3 is not lost in ELEC EMER CONFIG
    - IR 2 is recovered but faulty since not aligned, and PFD 2 and ND 2 are recovered after that generators are on.

    ATT HDG sw....................F/O ON 3
    ALL GENs....................ON

  - **When aircraft stopped:**

    ALL GENs....................OFF

- **If SMOKE AVNCS VENT SMOKE triggered:**

  The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

  VHF1/ATC1....................USE

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

CAUTION	*In the case of discrepancies between the airspeed indications on the Captain's PFD and on standby indicator, disregard the standby indicator (probe not deiced).*

Note:
1. *Only VOR 1 or ADF 1 (as selected on the DDRMI) is available. The VOR/ADF selector position on the FCU must be in accordance with the VOR/ADF selector on the DDRMI.*
2. *ENG ANTI-ICE pb-sw is ON, regardless of the pushbutton's position, so fuel consumption increases by approximately 1.5 %.*

CTR TANK XFR BY GRAVITY
CTR TK UNUSABLE IF < 15 T

Note: As fuel is fed from one side only, fuel balance must be monitored. To maintain fuel balance, L PUMP 2 can be selected OFF. R PUMP 2 will then automatically start (its corresponding FAULT light will go off).

WEIGHT/CG...INITIALIZE

This line appears because the FCMCs lose the WEIGHT/CG information, due to the power interruption that occurs before EMER GEN activation.
The GW and CG must be initialized again in the FCMC, by manually re-entering their values in the FUEL PRED page.

- **For slats extension:**
  RAT MAN...ON
  LAND RECOVERY...ON

  SFCC 1, LGCIU 1, BSCU 1, and WHC 1 are recovered. The remaining fuel pump is lost.

- **For L/G gravity extension:**

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING.......................................CONSIDER
  Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.

Guidelines to determine smoke/fumes source:

- If smoke/fumes initially come out of the cockpit's ventilation outlets, or if smoke/fumes are detected in the cabin, the flight crew may suspect an AIR COND SMOKE. In addition, very

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

shortly thereafter, several other SMOKE ECAM alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must therefore be applied.

- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceptible in the cockpit and/or cabin. In that case, it will be re-circulated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the SMOKE AVNCS VENT SMOKE alert is triggered, the flight crew may suspect avionics smoke/fumes
- If smoke/fumes are detected, while an equipment is declared faulty, the flight crew may suspect that smoke/fumes are coming from this equipment.

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: LV-KHT, LV-KHU

Ident.: PRO-ABN-SMOKE-L-00011660.0001001 / 09 NOV 21

This procedure includes all the steps of the SMOKE AVNCS VENT SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment.
- Requested by the SMOKE AVNCS VENT SMOKE procedure
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other SMOKE ECAM alert triggers (e.g. CARGO), the flight crew must first apply the ECAM procedure and then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the immediate actions that the flight crew must perform, if smoke/fumes are detected (with or without ECAM activation, and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In parallel, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the AT ANY TIME Items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

APPLY IMMEDIATELY

CREW OXY MASKS (if required).. USE / 100% / EMERG

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke/fumes from the mask.

VENTILATION EXTRACT.......OVRD

Avionics ventilation air is extracted overboard.

CAB FANS.......OFF

To prevent smoke/fumes from entering the cockpit and cabin.

GALLEY.......OFF
SIGNS.......ON
CKPT / CABIN COM.......ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

● **If smoke/fumes source immediately obvious, accessible and extinguishable:**
FAULTY EQT.......ISOLATE

● **If smoke/fumes source not immediately isolated:**
DIVERSION.......INITIATE

[QRH] REMOVAL OF SMOKE / FUMES

Ident.: PRO-ABN-SMOKE-00011627.0001001 / 05 MAY 22
Applicable to: ALL

Apply this [QRH] REMOVAL OF SMOKE / FUMES procedure, if smoke/fumes become the greatest threat when applying the [QRH] SMOKE / FUMES / AVNCS SMOKE procedure.

EMER EXIT LIGHT.......ON
PACK FLOW.......HI

To provide maximum airflow from the packs.
Do not shut down the air conditioning packs, and do not reduce ventilation in an attempt to smother the fire.
Do not deploy oxygen masks, if fire is suspected in the cabin.

LDG ELEV.......10 000 FT / MEA-MORA
DESCENT TO FL 100 / MEA-MORA.......INITIATE

Descent is initiated to FL 100, or the MEA-MORA, or the minimum obstacle clearance altitude, while the cabin altitude is increased to 10 000 ft or the MEA-MORA.
The increase in cabin altitude also reduces, at least temporarily, the smoke/fumes concentration.
Cabin depressurization starts, when descent is initiated.

ATC.......NOTIFY
SMOKE / FUMES / AVNCS SMOKE PROC.......CONTINUE

While descending, continue applying the appropriate steps of the [QRH] SMOKE / FUMES / AVNCS SMOKE procedure, depending on the suspected smoke/fumes source.
Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL.

- **At FL 100 or MEA-MORA:**
  PACK 1.......OFF
  PACK 2.......OFF

  It is not possible to open the cockpit window, when the packs are ON.

  CABIN PRESS MODE SEL.......MAN
  MAN VALVE SEL.......BOTH
  MAN V/S CTL.......FULL UP

  The outflow valves must be fully open to prevent repressurization when the RAM AIR valve is open.

  RAM AIR.......ON

  At FL 100, or MEA-MORA, or minimum obstacle clearance altitude, it is possible to open the RAM AIR valve, when ΔP is 1 PSI or below. RAM AIR does not assist smoke/fumes removal, but allows flying with both packs OFF (after window opening).

Continued on the following page

[QRH] REMOVAL OF SMOKE / FUMES (Cont'd)

- **If smoke/fumes persist:**

  If there is smoke/fumes in the cockpit, open the cockpit window to evacuate the smoke/fumes.

  MAX SPEED: 230 kt
  COCKPIT DOOR...OPEN
  HEADSETS...ON
  PM SLIDING WINDOW...OPEN

  - **When window is open:**

    NON-AFFECTED PACK(s)...ON
    VISUAL WARNINGS (noisy cockpit)..MONITOR

    Due to the increased noise level, pay particular attention to visual warnings.

    SMOKE / FUMES / AVNCS SMOKE PROC...CONTINUE

    Continue applying the appropriate steps of the [QRH] SMOKE / FUMES / AVNCS SMOKE procedure depending on the suspected smoke/fumes source.
    Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL.

[QRH] SMOKE / FIRE FROM LITHIUM BATTERY

FWD ISOL VALVE (IF NOT AUTOMATICALLY CLOSED).. OFF

- **IF FWD CRG CLOSED (displayed on ground only):**
  FWD AGENT.. DISCH

CAB FANS...OFF

- **ON GROUND BEFORE OPEN CRG DOORS:**
  PAX.. DISEMBARK

L2

1. Expect the SMOKE warning to remain after agent discharge, even if the smoke source is extinguished. Gases from smoke source are not evacuated, and smoke detectors are also sensitive to the extinguishing agent.
   Once the isolation valves are closed, the cargo is not ventilated. Therefore, the cargo temperature is unreliable
2. When ventilation is required for livestock transportation, the normal cargo ventilation may be recovered if:

   - The warning is displayed temporarily
   - The agent is not discharged.

   The normal cargo ventilation is recovered by resetting the cargo ventilation system by using the VENT CONT LANE 1 and LANE 2 reset buttons
3. If the SMOKE warning is displayed on ground, with the cargo compartment door open, do not initiate AGENT DISCHARGE. Request the ground crew to investigate and eliminate the smoke source
4. On ground, the warning may be triggered due to a high level of humidity or insecticide spraying. Provided that the smoke is not visually confirmed:
   - Deactivate the smoke detection system, by pulling the SDCU 1 and 2 reset pb-sw
   - Reset the cargo ventilation system, using the VENT CONT LANE 1 and LANE 2 reset buttons at the same time for a minimum of 5 s (but less than 10 s to avoid automatic shut-down of the IFE system)
   - At cargo doors closure, reactivate SDCU 1 and 2.

[MEM] TCAS CAUTION - TRAFFIC ADVISORY

Ident.: PRO-ABN-SURV-00025042.0002001 / 13 MAY 22
Applicable to: LV-KAN, LV-KAO

L2 If the AP/FD TCAS mode is available, the TCAS mode arms on FMA.

L1 TCAS mode..CHECK ARMED

L2 If the AP/FD TCAS mode does not arm, the flight crew must be prepared to disconnect the AP in the case of a RA, and manually follow the TCAS guidances.

L1 ● **If the A/THR is off:**

AUTOTHRUST..ON

L2 It is recommended to set the A/THR to ON in order to avoid the AUTO FLT A/THR LIMITED alert at the automatic A/THR activation that occurs in the case of a RA.

L1 Do not perform a maneuver based on a TA alone.

[MEM] TCAS CAUTION - TRAFFIC ADVISORY

Ident.: PRO-ABN-SURV-00025042.0001001 / 13 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT, LV-KHU

Do not perform a maneuver based on a TA alone.

[MEM] TCAS WARNING - RESOLUTION ADVISORY

Ident.: PRO-ABN-SURV-00011464.0007001 / 17 MAY 22
Applicable to: LV-KAN, LV-KAO

Always follow RA orders, even if this results in crossing the intruder altitude, because these orders ensure the best altitude separation.

CAUTION	Be aware that the intruder may have a TCAS, and may maneuver in response to a coordinated RA order. Therefore, not following an RA order could compromise safe separation.

■ **If the AP/FD TCAS mode is available:**

L2 The flight crew applies this procedure, when a RA triggered, and the AP/FD TCAS mode is engages. The AP/FD TCAS mode follows the RA orders.

L1
- **All RA, except any CLIMB RA during approach in CONF 3 or FULL:**
  - **If the AP is OFF:**

    FD ORDERS.. FOLLOW

    The AP can be engaged.

  VERTICAL SPEED.. MONITOR

L2 If a preventive RA was triggered: check that the vertical speed remains out of the red area of the vertical speed scale.

If a corrective RA was triggered: check that the vertical speed gets out of the red area, and remains in the green area of the vertical speed scale.

L1

CAUTION	If for any reason during a RA, the aircraft vertical speed does not reach the green area of the vertical speed scale, the PF should disconnect the AP, and override the FD orders, in order to lead the aircraft vertical speed out of the red area of the vertical speed scale. If necessary, the PF must use the full speed range between Vαmax and VMAX.

- **Any CLIMB RA during approach in CONF 3 or FULL:**

  GO-AROUND.. PERFORM

L2 The AP/FD TCAS mode disengages (the AP/FD does no longer follows the RA orders).

L1 Follow the SRS GA mode.

VERTICAL SPEED.. MONITOR

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

L2 Check that the vertical speed remains out of the red area of the vertical speed scale and take over if necessary.

L1 Respect stall, GPWS or windshear warnings.

ATC....................NOTIFY

- **When the "CLEAR OF CONFLICT" aural alert sounds:**

L2 The AP/FD TCAS mode, if engaged, disengages.

L1
AP/FD....................MONITOR/FOLLOW
ATC....................NOTIFY
LATERAL AND VERTICAL GUIDANCE....................ADJUST

L2 The flight crew should engage an appropriate vertical mode, or adjust the vertical speed target, in accordance with the latest ATC clearance.

L1 SPEED....................ADJUST

L2 The flight crew should adjust the speed target, and revert to managed speed, as appropriate.

L1 ■ **If the AP/FD TCAS mode is not available:**

L2 The flight crew must apply this procedure, when a RA is triggered, and the AP/FD TCAS mode does not engage.

L1
- **All RA, except CLIMB RA during approach in CONF 3 or FULL:**

AP (if engaged)....................OFF
BOTH FDs....................OFF

Respond promptly and smoothly.

VERTICAL SPEED....................ADJUST or MAINTAIN

L2 Adjusting or maintain the vertical speed as required, to reach the green area and/or avoid the red area of the vertical speed scale.

L1 *Note:* *Avoid excessive maneuvers while attempting to maintain the vertical speed just outside the red area of the vertical speed scale, and within the green area. If necessary, use the full speed range between Vαmax and VMAX.*

- **Any CLIMB RA during approach in CONF 3 or FULL:**

GO-AROUND....................PERFORM

Follow the SRS GA mode.

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

VERTICAL SPEED....................MONITOR

L2 Check that the vertical speed remains out of the red area of the vertical speed scale and take over if necessary.

L1 Respect stall, GPWS or windshear warnings.

ATC....................NOTIFY

- **When the “CLEAR OF CONFLICT” aural alert sounds:**

ATC....................NOTIFY
LATERAL AND VERTICAL GUIDANCE....................ADJUST

L2 Adjust the lateral and vertical guidance to resume normal navigation, in accordance with ATC clearance.

L1 AP/FD....................AS RQRD

L2 If necessary, reengage the AP/FD.

[MEM] TCAS WARNING - RESOLUTION ADVISORY

Ident.: PRO-ABN-SURV-00011464.0005001 / 17 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT, LV-KHU

Always follow RA orders, even if this results in crossing the intruder altitude, because these orders ensure the best altitude separation.

CAUTION	Be aware that the intruder may have a TCAS, and may maneuver in response to a coordinated RA order. Therefore, not following an RA order could compromise safe separation.

- **All RA, except any CLIMB RA during approach in CONF 3 or FULL:**

AP (if engaged).. OFF
FDs.. OFF

Respond promptly and smoothly.

VERTICAL SPEED.. ADJUST or MAINTAIN

L2 Adjust or maintain the vertical speed as required, depending on the green area, and/or to avoid the red area of the vertical speed scale.

L1 *Note:* *Avoid excessive maneuvers while attempting to maintain the vertical speed just outside the red area of the vertical speed scale, and within the green area. If necessary, use the full speed range between Vαmax and VMAX.*

- **Any CLIMB RA during approach in CONF 3 or FULL:**

GO-AROUND.. PERFORM

Follow the SRS GA mode.

VERTICAL SPEED.. MONITOR

L2 Check that the vertical speed remains out of the red area of the vertical speed scale and take over if necessary.

L1 Respect stall, GPWS, or windshear warnings.

ATC.. NOTIFY

- **When the “CLEAR OF CONFLICT” aural alert sounds:**

ATC.. NOTIFY
LATERAL AND VERTICAL GUIDANCE.. ADJUST

L2 Adjust the lateral and vertical guidance to resume normal navigation, in accordance with ATC clearance.

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

L1

AP/FD..AS RQRD

L2

If necessary, reengage the AP/FD.

[MEM] WINDSHEAR WARNING - REACTIVE WINDSHEAR

Ident.: PRO-ABN-SURV-00012300.0001001 / 04 NOV 20
Applicable to: ALL

If Windshear is detected, both PFDs display a WINDSHEAR message. An associated aural WINDSHEAR alert sounds three times.

If the flight crew detects WINDSHEAR, apply the following recovery technique:

■ Takeoff:

● If before V1:

If there are significant variations in airspeed, and in airspeed trend below the indicated V1, reject the takeoff.

L2 *If windshear occurs during the takeoff roll, the aircraft may reach V1 later (or sooner) than expected. The flight crew should ensure that there is sufficient runway remaining to stop the aircraft, if necessary.*

L1 **● If after V1:**

THR LEVERS....................TOGA
REACHING VR....................ROTATE
SRS ORDERS....................FOLLOW

If necessary, the flight crew may pull the sidestick fully back.

Note: If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary to prevent a loss of altitude, increase the pitch attitude.

■ Airborne - initial climb or landing:

THR LEVERS AT TOGA....................SET OR CONFIRM
AP (if engaged)....................KEEP ON
SRS ORDERS....................FOLLOW

If necessary, the flight crew may pull the sidestick fully back.

Note: 1. The autopilot disengages, if the angle of attack value goes above alpha prot.
2. If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary to prevent a loss of altitude, increase the pitch attitude.

DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF WINDSHEAR.

CLOSELY MONITOR THE FLIGHT PATH AND THE SPEED.

SMOOTHLY RECOVER TO NORMAL CLIMB OUT OF WINDSHEAR.

[QRH] WHEEL TIRE DAMAGE SUSPECTED

Ident.: PRO-ABN-WHEEL-00019865.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew must apply the WHEEL TIRE DAMAGE SUSPECTED procedure in the case of suspicion of damage on one or several tires.
There are several ways described in the FCTM to determine that one or several tires are damaged, *Refer to FCTM/PR-AEP-LG Wheel Tire Damaged Suspected*.

LDG DIST PROC...APPLY

Performance impact of one burst tire is equivalent to one brake released.

TAXI WITH CARE

Refer to LIM-LG Taxi with Deflated or Damaged Tires.

WHEEL HYD SEL VALVE

WHEEL HYD SEL VALVE (Cont'd)

Ident.: PRO-ABN-WHEEL-Q-00018710.0001001 / 21 MAR 16

- L2 If the normal brake selector valve is failed open, full green hydraulic pressure is present at normal servovalves' entry.
  Nosewheel steering remains available.
- L2 On ground, do not tow the aircraft with the green hydraulic system pressurized : If the steering selector valve is failed open, nosewheel steering remains pressurized, and so towing may either break the towbar's shear pin, or the nose gear (if towbarless towing).
- L2 If the steering selector valve is failed open, setting A/SKID & N/W STRG sw to OFF will cause the nosewheel to go to maximum deflection.

L1 A/SKID N/WS.. KEEP ON

GENERAL

Ident.: PRO-ABN-90-00010100.0001001 / 17 MAR 11
Applicable to: ALL

A successful outcome of an emergency situation depends, first of all, upon each crewmember's perfect knowledge and execution of the duties assigned to him/her.
The captain should frequently check that all crew members know exactly their assigned positions and their specific duties, as well as the duties of the other crew members, in case of an abnormal or an emergency condition.
Since it is not possible to cover all the situations which may occur, the captain will be responsible for adapting the following instructions, to obtain the best coordination of the emergency operation.
Should it be physically impossible for the captain to carry out his duties, another crewmember will substitute for him according to the chain of command.
The procedures in the manual are AIRBUS procedures and should be considered to be a reference.

COCKPIT-ASSIGNED DUTIES FOR EVACUATION

Ident.: PRO-ABN-90-00010101.0001001 / 03 NOV 21
Applicable to: ALL

■ If it is NOT POSSIBLE to reach the passenger cabin:

The flight crew should evacuate the aircraft via the cockpit clearview windows, by using the escape ropes.

On ground, each crewmember must help passengers, and direct them away from the aircraft.

■ If it is POSSIBLE to reach the passenger cabin:

CAPT	- Is the last person to leave the cockpit: Proceeds to the cabin and helps with passenger evacuation, as necessary - Is the last person to leave the aircraft: Checks that all persons have evacuated the aircraft - Evacuates the aircraft, via the rear door, or any other available exit, if the captain cannot reach the rear door - On ground, the captain takes command of operations until rescue units arrive.
F/O	- Proceeds to the cabin, and takes the emergency equipment - Evacuates the aircraft, using any available exit - Helps passengers on ground, and directs them away from the aircraft.

CABIN CREW-ASSIGNED AREAS FOR EVACUATION

Ident.: PRO-ABN-90-00010103.0001001 / 17 MAR 11
Applicable to: ALL

CABIN CREW DESIGNATION	ASSIGNED JUMPSEAT AND DOOR	ASSIGNED AREA
1 PURSER	DOOR 1 LH	FWD - ALL CABIN
1 CABIN CREW	DOOR 1 RH	FWD
2 CABIN CREWS	DOOR 2 RH/LH	MID/FWD
2 CABIN CREWS	DOOR 3 RH/LH	MID/AFT
2 CABIN CREWS	DOOR 4 RH/LH	AFT/MID

Note: These procedures are established for the minimum required number of 8 cabin crews.

COMMUNICATIONS

Ident.: PRO-ABN-90-00010104.0001001 / 27 FEB 18
Applicable to: ALL

1. EMERGENCY CALL

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- Press "EMER pb-sw" on the CALL panel, or - Passenger Address (PA) System: "PURSER TO COCKPIT PLEASE!"	The Purser must immediately go to the cockpit.
CABIN	COCKPIT	- Interphone: "PRIO CAPT"	Any cabin crewmember can make such a call. The cockpit crew must reply.

2. EMERGENCY ALERT

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "ATTENTION CREW! AT STATIONS!"	The cockpit crew makes a short and precise announcement to warn that an emergency evacuation may soon be required. Cabin crews must proceed to their emergency stations.

3. NOTIFICATION TO PASSENGERS

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- SIGNS ON - PA system	For psychological reasons, the cockpit crew should be the first to inform of an intended emergency landing.
PURSER	CABIN	- CABIN LIGHTS 100 % - PA System	Purser informs passengers that they have to pay special attention to these warnings: - "FINISH PREPARATION" - "BRACE FOR IMPACT" - "EVACUATE, EVACUATE"

4. FINISH PREPARATION

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- Passenger address (PA) System: "FINISH PREPARATION!"	The cockpit crew gives this order a short time before an emergency landing.

5. BRACE FOR IMPACT

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "BRACE FOR IMPACT!"	The cockpit crew announces to brace for impact approximately 1 min before landing.

6. INITIATE EVACUATION (RESTRICTED EXITS)

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "EVACUATE, EVACUATE" - Activate EVAC signals.	The cockpit crew orders an immediate evacuation, and the cabin crew directs passengers to all available exits.
CABIN	COCKPIT AND CABIN	- EVAC SIGNAL SYSTEM on FWD ATTND panel (FAP) - PA System or megaphone.	Used by the cabin crew, if there is no signal or order from the cockpit, and if it is unmistakably clear that the aircraft must be evacuated.
CABIN	CABIN	- Verbal	The cabin crew stands up and shouts: - "SEATBELTS OFF!" - "LEAVE EVERYTHING!" - "GET OUT!" - "COME THIS WAY!"

7. EVACUATION NOT REQUIRED

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "CABIN CREW and PASSENGERS REMAIN SEATED!"	When the Captain decides that an evacuation is not required, the cockpit crew makes an immediate announcement to this effect.

ON GROUND EVACUATION

Applicable to: ALL

Ident.: PRO-ABN-90-A-00010105.0001001 / 16 JAN 18

COCKPIT CREW PROCEDURES

The cockpit crew notifies the cabin crew of the nature of the emergency, and states intentions.

The cockpit crew uses the Passenger Address system, to make an appropriate announcement, such as: “EVACUATE, EVACUATE”, and presses the EVAC COMMAND pb ◁ .

Ident.: PRO-ABN-90-A-00010106.0001001 / 26 JAN 18

CABIN CREW PROCEDURES

When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:

STAND UP AND SHOUT..........."UNFASTEN SEATBELTS"
OUTSIDE CONDITIONS...........CHECK

- **If outside conditions are safe:**

  DOOR IN ARMED POSITION...........OPEN FIRMLY
  SHOUT..........."COME THIS WAY"

  - **If the door does not open automatically:**

    DOOR...........PUSH AND OPEN MANUALLY

  SLIDE (or SLIDERAFT) DEPLOYMENT...........CHECK FULL DEPLOYMENT

  It takes approximately 4 s for the slide (or slideraft) to deploy.

  - **If the slide (or slideraft) does not automatically inflate:**

    RED, MANUAL INFLATION HANDLE...........PULL

    The red, manual inflation handle is located on the right-hand side of the slide (or slideraft) girt extension.

  ORDER..........."EVACUATE, EVACUATE"
  PASSENGER EVACUATION...........EXPEDITE

  - **If the slide (or slideraft) becomes unserviceable:**

    PASSENGER EVACUATION...........STOP
    PASSENGERS TO ANOTHER USABLE EXIT...........REDIRECT

  TOTAL ZONE EVACUATION...........CHECK
  CABIN CREW...........EVACUATE
  PASSENGERS AWAY FROM THE AIRCRAFT...........DIRECT

- **If outside conditions are unsafe:**

  EXIT DOOR...........BLOCK
  PASSENGERS TO NEAREST USABLE EXIT...........REDIRECT

COCKPIT EVACUATION THROUGH WINDOW

Applicable to: ALL

Ident.: PRO-ABN-90-B-00010107.0001001 / 05 AUG 10

OPENING THE SLIDING WINDOW

HANDLE....................PUSH DOWN AND PULL BACK

Pulling the handle backwards, opens the sliding window.

Ident.: PRO-ABN-90-B-00010108.0001001 / 24 NOV 15

COCKPIT EVACUATION WITH ESCAPE ROPE

ESCAPE ROPE STOWAGE....................OPEN

The escape rope stowage is located above the sliding window, on either side of the overhead panel.

ESCAPE ROPE....................UNROLL

Unroll the escape rope, and throw it through the window.

SEAT....................STEP ON

ESCAPE ROPE....................GRASP

Grasp the escape rope firmly with both hands, and slide down along the rope.

EVACUATION ON WATER

Applicable to: ALL

Ident.: PRO-ABN-90-C-00010109.0001001 / 17 MAR 11

CABIN CREW RESPONSIBLE FOR TYPE “A” DOORS

- **When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:**

  CHILDREN LIFEVESTS....................DISTRIBUTE

  STAND UP AND SHOUT....................
  ...."UNFASTEN SEATBELTS-PUT ON YOUR LIFEVEST"

  Inflate the lifevest, only once outside the aircraft.

  ORDER...................."REMOVE SHOES"

- **If the Type A door is usable:**

  DOOR IN ARMED POSITION....................OPEN

  SLIDERAFT....................DEPLOY

  RED, MANUAL INFLATION HANDLE....................PULL

  Do not wait for automatic inflation of the slideraft.

■ **If the water level is close to the door sill:**

The slideraft inflates on the water.

SLIDERAFT...LEAVE ATTACHED TO CABIN FLOOR
PASSENGER LIFEVESTS.....................................INFLATE WHEN BOARDING SLIDERAFT
PASSENGERS... BOARD SLIDERAFT
TOTAL ZONE EVACUATION...CHECK
LAST CREWMEMBER... BOARD SLIDERAFT
SLIDERAFT.. SEPARATE FROM DOOR SILL

The last crewmember must separate the slideraft from the door sill, and board with all the necessary safety equipment.

MOORING LINE...CUT
SURVIVAL KIT.. RETRIEVE

The survival kit is attached to the slideraft via a lanyard.

■ **If the water level is too far away from the door sill:**

SLIDERAFT...DISCONNECT FROM DOOR SILL

The slideraft remains tied to the aircraft by a 6 m (20 ft) mooring line.

MOORING LINE...HOLD

To keep the slideraft close to the exit, hold the mooring line.

PASSENGER LIFEVESTS.....................................INFLATE WHEN BOARDING SLIDERAFT
PASSENGERS... BOARD SLIDERAFT
TOTAL ZONE EVACUATION...CHECK
LAST CREWMEMBER... BOARD SLIDERAFT

The last crewmember must board with all the necessary safety equipment.

MOORING LINE...CUT
SURVIVAL KIT.. RETRIEVE

The survival kit is attached to the slideraft via a lanyard.

Ident.: PRO-ABN-90-C-00010110.0001001 / 05 AUG 10

CABIN CREW RESPONSIBLE FOR EMERGENCY EXIT TYPE "I" DOORS

● **When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:**

CHILDREN LIFEVESTS..DISTRIBUTE
STAND UP AND SHOUT..
...."UNFASTEN SEATBELTS — PUT ON YOUR LIFEVEST"
ORDER..."REMOVE SHOES"

Note: *Evacuation is usually done through the passenger doors. However, if one of the passenger doors is not usable, Exit 3 door (Type 1) may be used for evacuation, and the slide may be used as a flotation device.*

FOREWORD

Ident.: PRO-NOR-SOP-01-00010854.0001001 / 05 DEC 17
Applicable to: ALL

The procedures contained in this Chapter are recommended by Airbus, and are consistent with the other Chapters of this manual.

The Authorities do not certificate Standard Operating Procedures. The manufacturer presents them herein as the best way to proceed, from a technical and operational standpoint. They are continually updated and the revisions take into account Operator input, as well as manufacturer experience.

In addition, Operators may amend them, as needed. However, the manufacturer recommends that Operators using the FCOM as onboard operational manual submit suggested changes to expedite publication, and maintain consistency of the manual. The Operator should note that they may rewrite this Chapter, at their own responsibility ; this could, however, make it difficult to update the manual and keep it consistent with the other Chapters.

The following sections contain expanded information on normal procedures.

Standard Operating Procedures consist of inspections, preparations, and normal procedures. All items of a given procedure are listed in a sequence that follows a standardized scan of the cockpit panels, unless that sequence goes against the action priority logic, to ensure that all actions are performed in the most efficient way.

These procedures assume that all systems are operating normally, and that all automatic functions are used normally.

Standard Operating Procedures consider that both pilots use Electronic Flight Bag (EFB). Airbus recommends operating with two EFBs in order to reduce the risk of erroneous inputs.

The FCOM also contains normal procedures that are non-routine procedures in the Supplementary Procedures chapter and in the Special Operations chapter.

Intentionally left blank

GPS PRIMARY AVAILABILITY (IF INSTALLED)

Ident.: PRO-NOR-SOP-02-00014828.0006001 / 06 NOV 23
Applicable to: ALL

- **For RNP1/RNP2/RNP4 operations, RNP APCH/RNAV(GNSS) approaches, and RNP AR/RNAV(RNP) ◁ approaches:**

  GPS PRIMARY availability is demonstrated to be available 100 % of the time with 24 healthy satellites.

  If required by operational regulation, for specific conditions (e.g. RNP AR/RNAV(RNP), mountainous terrain, or less than 24 satellites), an appropriate Ground-Based Prediction Program should be used to check the GPS PRIMARY availability for each intended procedure (arrival, departure, and alternate if required).

Intentionally left blank

SAFETY EXTERIOR INSPECTION

Applicable to: ALL

Ident.: PRO-NOR-SOP-03-A-00010458.0001001 / 09 NOV 21

GENERAL

Safety exterior inspections ensure that the aircraft and the external environment of the aircraft are safe for operation. When the flight crew arrives at the aircraft, they must check for, or be informed of any obstructions near the aircraft, engineering activity, or refueling activity, etc.

BATTERIES CHECK/EXTERNAL POWER

Ident.: PRO-NOR-SOP-04-00010900.0002001 / 09 NOV 21
Applicable to: LV-GKO, LV-GKP
Impacted by TDU: 00014152 Batteries Check/Setup

- **If the aircraft has not been electrically supplied for 6 h or more, perform the following check:**

  BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw................................CHECK OFF | CM2
  BAT 1 and 2 and APU BAT VOLTAGE...............................CHECK ABOVE 25.5 V | CM2

  L2 *Battery voltage above 25.5 V ensures a charge above 50 %. After the check, the selector should remain on the APU position to avoid discharge of BAT 1 or 2.*

  L1
  - **If the battery voltage is at or below 25.5 V:**

    a charging cycle of about 20 min is required.

    BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw....................................AUTO | CM2
    EXT PWR..ON | CM2

    L2 *Check on ELEC DC SD page, battery contactors closed and batteries charging.*

    L1
    - **after 20 min:**

      BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw................................OFF | CM2
      BAT 1 and 2 and APU BAT VOLTAGE...................CHECK ABOVE 25.5 V | CM2

      L2 *After the check, the selector should remain on the APU position.*

  L1
  - **If the battery voltage is above 25.5 V:**

    BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw....................................AUTO | CM2

    Note: If the aircraft is supplied by batteries only: After 5 min the ground horn will trigger, and the ventilation EXTRACT FAULT light will come on, along with the ECAM warning.

- **If the aircraft has been electrically supplied during the last 6 h:**

  BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw.. AUTO | CM2

L12

Note: In case of APU start on battery only, perform the following check:

BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw.............................AUTO | CM2
BAT 1 and 2 and APU BAT..................................CHECK ABOVE 23.5 V | CM2

If one battery voltage is lower than 23.5 V, there is a risk that APU start aborts. A charging cycle of the battery is required.

- **If the AVAIL light is on:**

  EXT PWR pb....................ON | CM2

  Note: 1. If only one electrical power is available, the ground personnel should connect EXT PWR A since:
  - *EXT PWR B does not permit to supply directly GND/FLT buses without energizing the total aircraft network.*
  - *The simultaneous use of EXT PWR B and APU GEN is not possible.*

  2. If AVAIL does not come on (EXT PWR connected) or ON/AVAIL go out during EXT PWR operation, the GPCU protection trips. Use the EXT PWR to reset.

BATTERIES CHECK/EXTERNAL POWER

Ident.: PRO-NOR-SOP-04-00010900.0002001 / 09 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

■ **If the aircraft has not been electrically supplied for 6 h or more, perform the following check:**

BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw....................CHECK OFF | CM2
BAT 1 and 2 and APU BAT VOLTAGE....................CHECK ABOVE 25.5 V | CM2

L2 *Battery voltage above 25.5 V ensures a charge above 50 %. After the check, the selector should remain on the APU position to avoid discharge of BAT 1 or 2.*

L1 ■ **If the battery voltage is at or below 25.5 V:**

a charging cycle of about 20 min is required.

BAT 1 pb-sw, BAT 2 pb-sw and APU BAT pb-sw....................AUTO | CM2
EXT PWR....................ON | CM2

L2 *Check on ELEC DC SD page, battery contactors closed and batteries charging.*

L1 ● **after 20 min:**

APU FIRE

APU FIRE pb-sw	CHECK IN and GUARDED	CM2
APU AGENT light	CHECK OFF	CM2
APU FIRE TEST pb	PRESS and MAINTAIN	CM2

TEST RESULT

Check that the APU fire detection and extinguishing system is operative:
- APU FIRE warning on (if AC power available):
  - ECAM
  - CRC
  - MASTER WARN light.
- APU FIRE pb-sw lighted red (lighted partially if AC power not available)
- SQUIB light and DISCH light on.

Ident.: PRO-NOR-SOP-04-C-00010903.0002001 / 24 NOV 23

APU START

APU MASTER SW pb-sw ....ON | CM2

● **If batteries only are supplying:**
APU pb (on the ECAM control panel)..PRESS | CM2

L2 *This action enables the display of the APU SD page on the upper ECAM.*

L1 APU START pb-sw ....ON | CM2

L2 *To increase the APU START performance, Airbus recommends to set the APU START pb-sw to ON 3 min after the flight crew sets the APU MASTER SW pb-sw to ON. This ensures the APU fuel feed line is sufficiently pressurized.*
For more information on the APU start, Refer to APU Controls and indicators/Overhead panel.

L1 *Note: In cold weather conditions (below approximately 10 °C), the flight crew may observe a bleed pressure up to 12 PSI with possible fluctuations on the APU SD page and the BLEED SD page.*

L2 *For more information on APU starter limitations and APU operations during refueling:*
- *Refer to LIM-APU APU Start*
- *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling.*

L1 ● **When the APU is AVAIL:**
APU BLEED pb-sw ....ON | CM2

L2 *Do not use APU BLEED, if the ground personnel confirms that a LP or HP ground air unit is connected to the aircraft.*
To determine if a HP ground air unit is connected, the flight crew should also check on the BLEED SD page, if there is pressure in the bleed air system.

L1 ALL WHITE lights..OFF | CM2
X-BLEED rotary selector ....AUTO | CM2
COCKPIT TEMP rotary selector and CABIN TEMP rotary selector ....AS RQRD | CM2

L2 *Full range temperature 24 ± 6 °C (75 ± 11 °F).*
The temperature selection recommended for the cabin is 21.5 °C (about 10 o'clock).

L1 * EXT PWR pb .... AS RQRD | CM2

L2 *The flight crew should keep the external power units ON to reduce the APU load, particularly in hot weather conditions.*

ADIRS

Ident.: PRO-NOR-SOP-04-00011860.0004001 / 03 NOV 22
Applicable to: ALL

ADIRS

* ALL IR MODE selector .... NAV | CM2

L2 *Align or realign IRS as appropriate. Refer to FCTM/PR-NP-SOP-40 ADIRS Operations.*

A complete IRS alignment must be performed in the following cases:

- Before the first flight of the day, or
- When there is a crew change, or
- When the departure airport is located between latitudes 2 ° north and 2 ° south, or
- When the GPS is not available and the NAVAID coverage is poor on the expected route, or
- When the GPS is not available and the expected flight time is more than 3 h.

A fast IRS alignment must be performed if a complete IRS alignment is not necessary.
To perform an alignment, the aircraft must be stopped on ground. Do not align IRS during engine start, or while the engines are running. In the case of aircraft movement during the IRS alignment, the flight crew must perform a new full alignment.

COCKPIT LIGHTS

Ident.: PRO-NOR-SOP-04-00010908.0001001 / 09 NOV 21

EFB/ACARS (IF INSTALLED) INITIALIZATION

Applicable to: ALL

Ident.: PRO-NOR-SOP-04-B-00021766.0001001 / 09 NOV 21

EFB START

ALL EFB...START |CM1-CM2

- **In accordance with the Operator's policy or if required by operational regulation:**

  EFB/eQRH VERSION...CHECK |CM1-CM2

  If required, the flight crew performs this check unless a specific procedure is established as per Operator's policy to ensure that the correct version is onboard.

  On the EFB STATUS page and the eQRH My aircraft page, check the EFB VERSION number and compare it with the valid version number given as reference by the Operator (e.g. on the company flight plan).

Ident.: PRO-NOR-SOP-04-B-00026029.0001001 / 28 NOV 23

ACARS ◁ INITIALIZATION

* ACARS ◁ .... INITIALIZE | CM1

L2 *Initialize ACARS if not done automatically, as per company policy.*

Ident.: PRO-NOR-SOP-04-B-00021756.0001001 / 04 DEC 18

FMGS PRE-INITIALIZATION

Perform FMGS Pre-Initialization in the case of ACARS ◁ operations or EFB operations with SYNCHRO AVIONICS ◁ .

At electrical power-up, the FMGSs and FCU run through various internal tests. Allow enough time (3 min) for tests' completion, and do not start to press pushbuttons until the tests are over. If the "PLEASE WAIT" message appears, do not press any MCDU key until the message clears.

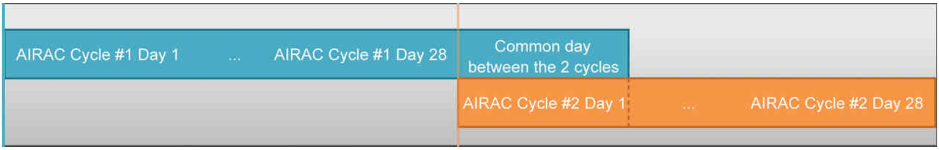
Ident.: PRO-NOR-SOP-04-B-00021754.0001001 / 09 NOV 21

* ENGINE & AIRCRAFT TYPE.. CHECK | CM1

Ident.: PRO-NOR-SOP-04-B-00021788.0001001 / 09 NOV 21

* FM database validity.. CHECK | CM1

- *Check the DATA BASE validity and stored WPT/NAVAIDS/RWY/ROUTES, if any. If applicable, review the stored data for deletion decision.*
- *On Honeywell FMS, the double AIRAC cycle of the NDB has one day in common (AIRAC Cycle #1 Day 29 / AIRAC Cycle #2 Day 1). From Day 2 of AIRAC Cycle #2, the active database is no longer valid and the message "CHECK DATA BASE CYCLE" will be triggered.*
  On the common day, select AIRAC Cycle #2 prior to the first flight of the day.



Ident.: PRO-NOR-SOP-04-B-00021706.0001001 / 09 NOV 21

* FLT NBR.. INSERT/CHECK | CM1

L2 *Insert FLT NBR only if the company flight plan is not received via ACARS.*

L1 * FROM/TO.. INSERT/CHECK | CM1

L2 *Insert FROM/TO only if the company flight plan is not received via ACARS.*

Ident.: PRO-NOR-SOP-04-B-00021767.0001001 / 09 NOV 21

EFB STATUS PAGE

* EFB SYNCHRO AVIONICS ◁ .... CLICK | CM1-CM2
* EFB STATUS page.. INSERT/CHECK | CM1-CM2

L2 On the EFB STATUS page, each flight crewmember checks or, inserts and checks (if no EFB SYNCHRO AVIONICS):
- ACFT TYPE and ACFT REG
- FLT NBR and FROM/TO (in agreement with the FMS ACTIVE/INIT page).

AIRCRAFT ACCEPTANCE

Ident.: PRO-NOR-SOP-04-00021759.0002001 / 24 NOV 23
Applicable to: LV-KHT, LV-KHU

* RCL pb......................................PRESS 3 s | CM1

L2 *This action recalls all the warnings that the flight crew cleared or cancelled during the last flight.*

L1 * LOGBOOK AND MEL/CDL ITEMS......................CHECK | BOTH

L2
- *Check the deferred items list*
- *Crosscheck with ECAM recall.*

All flight crewmembers:
- *Check and discuss the technical condition of the aircraft (deferred items list)*
- *Check and discuss the MEL items (including the associated operational procedures, if any) and the CDL items. This includes the acceptability of the MEL and CDL items and the influence on the flight plan*
- *Activate the MEL and CDL items (the activated MEL and CDL items are sent to the performance applications)*
- *In icing conditions with OAT below +1 °C (34 °F) check the taxi-in time in freezing fog of the previous flight recorded in the logbook. This time will be used to determine the remaining taxi-out time before the next engine acceleration for ice shedding (Refer to PRO-NOR-SUP-ADVWXR Engine Ice Shedding on Ground).*

L1 AIRCRAFT CONFIGURATION SUMMARY......................CHECK | BOTH

L2 *For awareness of the current aircraft configuration, both flight crewmembers discuss together the optional installed aircraft systems and functions, and their influence on the ongoing flight.*

L1 * OEB......................................CHECK | BOTH

L2 *All flight crewmembers review and discuss together all OEBs and associated procedures applicable to the aircraft.*
Any flight crewmember who operates at the flight deck at any time during the on-going flight should be aware of the applicable OEB(s).

L1 * AIRCRAFT ACCEPTANCE......................PERFORM | CM1

Note: *The aircraft acceptance can be performed later, but must be completed at the end of the Cockpit Preparation.*

AIRCRAFT ACCEPTANCE

PRELIMINARY PERFORMANCE DETERMINATION

Ident.: PRO-NOR-SOP-04-00021760.0001001 / 24 NOV 23
Applicable to: ALL

For more information, *Refer to FCTM/PR-NP-SOP-PRELIMINARY COCKPIT PREPARATION-Preliminary Takeoff Performance Computation*.

Each flight crewmember independently computes the preliminary performance data in accordance with the technical condition of the aircraft and/or any other criteria that may affect the aircraft performance (e.g. NOTAM, runway condition, aircraft configuration).

* AIRFIELD DATA....................................OBTAIN | CM1-CM2

L2 *Obtain data needed for initializing the system, preparing the cockpit and for preliminary takeoff performance computation. The airfield data should include: RUNWAY IN USE, ALTIMETER SETTING, and WEATHER DATA.*

L1
- **If the LOADSHEET application is used:**
  * PRELIMINARY LOADING....................COMPUTE AND CROSSCHECK | CM1-CM2
- **If dispatch under MEL and in accordance with the logbook:**
  * MEL/CDL ITEMS (as appropriate)....................CHECK ACTIVATED | CM1-CM2

L2 *As appropriate, check that the MEL and CDL items are activated in the applicable performance application.*

L1 * NAV CHARTS CLIPBOARD....................................PREPARE | BOTH

L2 *Prepare the necessary charts and verify that both flight crewmembers refer to the same chart reference.*

L1 * PRELIMINARY TAKEOFF PERF DATA....................................COMPUTE | CM1-CM2

L2 *Both flight crewmembers discuss together and decide all of the following:*
- *RWY to be used*
- *RWY intersection*
- *Flaps setting*
- *Use of anti-ice*
- *Use of packs*
- *Takeoff thrust setting options (FLEX, TOGA, DERATE).*

The PF and the PM independently compute the preliminary takeoff performance data.

L1 * PRELIMINARY TAKEOFF PERF DATA....................................CROSSCHECK | BOTH

L2 *The PF and the PM compare and ensure that the computations are the same.*

Intentionally left blank

GENERAL

Ident.: PRO-NOR-SOP-05-00011095.0001001 / 05 MAY 22
Applicable to: ALL

The exterior walkaround ensures that the general condition of the aircraft is satisfactory and that the visible aircraft components and equipment are safe for the flight:

- There is no impact damage to the structure
- There is no evident fuel, oil, or hydraulic leak
- All ground access doors are closed
- All covers are removed (e.g. pitot covers, AOA covers, etc.).

The flight crew must perform a complete walkaround before each flight.
The parking brake must be set to ON during the exterior walkaround, in order to enable the flight crew to check brake wear indicators.

WARNING	If any landing gear door is open, do not apply hydraulic power until clearance is obtained from ground personnel.

EXTERIOR WALKAROUND

GENERAL

Ident.: PRO-NOR-SOP-06-00011855.0001001 / 09 NOV 21
Applicable to: ALL

Items marked by (*) are the only steps to be completed after a transit stop without flight crew change. Otherwise, the new flight crew performs all the items.
The PF prepares the overhead panel, the center instrument panel and the pedestal while the PM performs the external walkaround. When both flight crewmembers are seated and the PM checked the FMS, both flight crewmembers continue the cockpit preparation.

WARNING	Do not pressurize the hydraulic systems until clearance is obtained from ground personnel.

* ATC SYS 1 .... SELECT | PF

L2 *For RVSM operations (Refer to PRO-SPO-50 Required Equipments/Functions for RVSM), select SYS 1 if AP 1 is used, and SYS 2 if AP 2 is used.*
Only system 1 is available in the Emergency Electrical Configuration.

ATC DATALINK COMMUNICATION

Ident.: PRO-NOR-SOP-06-00013823.0001001 / 09 NOV 21
Applicable to: ALL

* MSG .... ERASE | PF

L2 *Press ATC COMM key of the MCDU and display the MSG LOG page.*
Then, erase the MSG LOG file.

Note: *Erase the record of CPDLC message of the previous flight before starting a new flight where CPDLC will be used. This avoid confusing CPDLC message from the previous flight with the ones of the current flight.*

L1 * ADS .... CHECK ARMED | PF

L2 *Press the ATC COMM key on the MCDU and display the CONNECTION STATUS page.*
Check if the ADS is armed. If not, arm the ADS.

FMGES PREPARATION

Ident.: PRO-NOR-SOP-06-D-00011893.0001001 / 09 NOV 21
Applicable to: ALL

GENERAL

At electrical power-up, the FMGSs and FCU run through various internal tests. Allow enough time (3 min) for tests' completion, and do not start to press pushbuttons until the tests are over. If the “PLEASE WAIT” message appears, do not press any MCDU key until the message clears.

In the case of ACARS ◁ operations, or EFB operations with SYNCHRO AVIONICS ◁ , the following actions are already performed in the section "FMGS Pre-Initialization" of the PRELIMINARY COCKPIT PREPARATION procedure and do not need to be performed again:

- ENGINE & AIRCRAFT TYPE check
- FM database validity check
- Flight plan initialization:
  - FLT NBR insertion
  - FROM/TO insertion.

Refer to PRO-NOR-SOP-04 EFB/ACARS Init - FMGS Pre-Initialization - General,

ACTIVE F-PLN CHECK

* F-PLN A page..COMPLETE AND CHECK | PF

L2 *If CO RTE has been inserted, the F-PLN should automatically include the preferential or most probable takeoff runway, approach and landing runway, associated SIDs, STARs, transition and enroute waypoints. However, some databases will only include departure and arrival airport IDENTs and enroute waypoints.*

The flight crew must check, modify, or insert (as applicable) the F-PLN in the following order according to the data given by ATIS, ATC or MET:

- *Lateral revision at departure airport. Select RWY, then SID, then TRANS, using the scroll keys*

  Note: On the MCDU DEPARTURES page, select only a runway associated with an ILS or NO NAVAIDS.

- *Lateral revision at WPT for ROUTE modification, if needed. For more information on lateral revision, Refer to DSC-22_20-30-10-05 Lateral Revisions.*
- *Vertical revision. Check or enter climb speed limit and speed constraints according to ATC clearance. Enter step altitude, as appropriate.*

L1 * WINDS...AS APPROPRIATE | PF

L2 *Choose between TRIP WIND (INIT FUEL PRED page), or forecast wind, for CLB, CRZ and DES phase. For detail, Refer to DSC-22_20-30-20-25 Wind - Temperature - QNH - Entering the Trip Wind and Temperature During the F-PLN Initialization.*

L1 * F-PLN... CHECK | PF

L2
- *Check the F-PLN, either by using the ROUTE SELECTION page versus ATC F-PLN or F-PLN page, or the ND PLAN mode versus the computer (paper) flight plan or navigation chart*
- *Check DIST TO DEST along the F-PLN. Compare it with the total distance computed for the flight with the computer (paper) flight plan.*

Ident.: PRO-NOR-SOP-06-D-00011899.0001001 / 24 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

ACTIVE F-PLN CHECK

* F-PLN A page..COMPLETE AND CHECK | PF

DERATED CLIMB ◁ LEVEL INSERTION

* DERATED CLIMB..AS RQRD | PF

L2 *If a derated climb is planned, insert the derated climb level (D1 or D2) in the DRT CLB field of the MCDU PERF CLB page.*

Ident.: PRO-NOR-SOP-06-D-00011905.0001001 / 09 NOV 21
Applicable to: ALL

CLIMB, CRUISE, DESCENT SPEED PRESELECTION

* PRESET SPEEDS.. AS RQRD | PF

L2 *If the flight is cleared for a close-in turn or close-in altitude constraint, the flight crew may preselect green dot speed on the PERF CLB page. Once the CLB phase is active, the preselected speed will be displayed in the FCU speed window and on the PFD as a selected speed (blue symbol). Once the turn is completed or the altitude cleared, the pilot will resume the managed speed profile by pressing the SPD/MACH knob on the FCU. Similarly, the pilot may select a CRZ MACH number on the PERF CRZ page (constant CRZ Mach segment, for example). When the CRZ phase is active, the preselected CRZ MACH number will be displayed in the FCU speed window and on the PFD. When ECON MACH number may be resumed, the crew presses the FCU SPD/MACH knob selector.*

In either of the above cases, the pilot may cancel the CLB or CRZ preselected SPD/MACH prior to activating the related phase, by selecting ECON on the PERF CLB or CRZ pages.

SPD LIM is defaulted to 250 kt below 10 000 ft in the managed speed profile. This may either be cleared, or modified, on the VERT REV page at the origin (or a climb waypoint).

Ident.: PRO-NOR-SOP-06-D-00015238.0001001 / 05 MAY 22
Applicable to: ALL

CHECK OF FMGES PREPARATION:

* FMS PREPARATION... CROSSCHECK | PM

L2 *After the PF prepares the FMS, the PM checks all the data entered in the FMS. This check includes a crosscheck between:*

- *Waypoints of the expected departure route that include constraints*
- *Waypoints of the flight plan and the computerized flight plan*
- *Initial cruise altitude and the computerized flight plan*
- *Total track miles and the computerized flight plan*
- *Fuel remaining at destination and the computerized flight plan*
- *Performance data displayed on the PM's EFB with the PERF TAKE OFF page. This includes modifications of the THR RED/ACCEL/EO ACCEL settings, if applicable*
- *TRANS ALT in the ACTIVE/PERF page*
- *Setup of the SEC flight plan.*

The PM should have the same mental image of the intended departure procedure, trajectory, and constraints as the PF. The PM should check with the PF if anything is not clear.

L1 * EFB/MCDU GREEN DOT..COMPARE | PM

L2 *The PM compares Green Dot speed computed by the FMGES and the Green Dot speed computed using the TAKEOFF application. A discrepancy indicates a difference in the TOW used in both systems (EFB/FMGES).*

WINDOWS AND DOORS

WINDOWS and DOORS..CHECK CLOSED | PF-PM

L2
- *To ensure that the sliding window is correctly closed and locked, push the handle of the sliding window fully forward to the closed position, and verify that the red indicator is no longer visible*
- *Check, on the ECAM lower display, that all the aircraft doors are closed*
- *When required by local airworthiness authorities, check that the cockpit door is closed and locked (no cockpit door open/fault indication).*
  If entry is requested, identify the person requesting entry before unlocking the door. With the cockpit door selector on NORM, the cockpit door is closed and locked. If entry is requested from the cabin, and if no further action is performed by the pilot, the cabin crew will be able to unlock the door by using the emergency access procedure. Except for crew entry/exit, the cockpit door should remain closed until engine shutdown.

L1 *Note:* *Starting one engine with a door not closed will result in pack valve closure.*

SLIDES..CHECK ARMED | PF-PM

L2 *Check, on the ECAM lower display, that all slides are armed.*

WEATHER RADAR

RADAR..ON | PM

L2 *To check the departure path, set the MULTISCAN toggle switch to MAN. The flight crew can then set the radar to the AUTO position.*
Gain must be manually set to +4, when MULTISCAN selector is set to AUTO and when flying below FL 200.

L1 *Note:* *1. If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique.*
2. In particular below FL 200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to MAN mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display.
3. In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and MAN modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.

Applicable to: ALL

PACKS

PACK 1 pb-sw and PACK 2 pb-sw...AS RQRD | PM

L2 *Consider setting the packs to OFF, or the APU bleed pb-sw to ON. This will improve performance, when using TOGA thrust.*
If a takeoff is performed with the packs OFF : The packs must be set to OFF at least 20 s before applying takeoff thrust.
In the case of a FLEX takeoff, setting the packs to OFF, or the APU bleed pb-sw ON, will reduce takeoff EGT, and consequently reduce maintenance costs.
Use of the APU bleed is not permitted, if wing anti-ice is to be used.
Set the APU bleed pb-sw to ON at least 20 s before applying takeoff thrust. This will prevent the ENG THRUST LOSS alert from triggering due to incorrect valve position.

L2 *When icing conditions are encountered:*

- *The flight crew may turn on the wing anti-ice to prevent ice accretion on the wing leading edge*
- *The flight crew must turn on the wing anti-ice if there is evidence of ice accretion, such as ice on the visual indicator, or on the wipers, or with the SEVERE ICE DETECTED alert. This is to remove any ice accumulation from the wing leading edge.*

Intentionally left blank

CLIMB

Ident.: PRO-NOR-SOP-14-A-00012131.0001001 / 24 NOV 23
Applicable to: ALL

Normal vertical mode is CLB or OP CLB with managed speed active.

PF MCDU....................PERF CLB | PF

L2
- *PF MCDU should be showing the PERF CLB page (allowing PF to monitor when the aircraft will reach the FCU selected altitude) but the flight crew may select other pages such as F-PLN page as may be tactically necessary*
- *The PROG page displays OPT FL and REC MAX FL. It is worth noting that this OPT FL is a function of the cost index (CI).*
- *The displayed REC MAX FL gives the aircraft at least a 0.3 g buffet margin. The flight crew may enter a cruise flight level above this level into the MCDU and the FMGS will accept it, provided that it does not exceed the level at which the margin is reduced to 0.2 g.*

L1 PM MCDU....................F-PLN | PM

L2 *PM MCDU should be showing the F-PLN page (allowing PM to enter any ATC long-term revisions to the lateral or vertical flight plan).*

L1

CLIMB SPEED MODIFICATIONS:

- **If a speed change is required by ATC, or for turbulence or operational considerations (e.g. increase CLB rate):**

  Select the new speed with FCU SPD selection knob and pull.

  Speed target is now selected.

- **To resume to MANAGED SPD profile:**

  Push FCU SPD selection knob. Speed target is now managed.

  Note: *The best rate of climb speed for long term situations lies between green dot and ECON speed. Acceleration from green dot to ECON speed at high altitude can take a long time.*

RADAR

RADAR..ADJUST AS APPROPRIATE | PF

Gain must be manually set to +4, when MULTISCAN sw is set to AUTO and when flying below FL 200.

Note: *1. If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt until displaying ground echoes*
2. If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique
3. In particular below FL 200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to Manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display
4. In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and Manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.

FLIGHT PROGRESS

FLIGHT PROGRESS....................CHECK | PF-PM

L2 *Note: VLS, shown on the PFD, ensures a 0.3 g buffet margin. Therefore, no additional margin is necessary in cruise.*

L1 Monitor flight progress in the conventional way.

WHEN OVERFLYING A MANUALLY ENTERED WAYPOINT

- Check track and distance to the next waypoint
- Check the wind and update it if the current wind is significantly different.

WHEN OVERFLYING A WAYPOINT, OR AT LEAST EVERY 30 MIN

Check FUEL:

- Check FOB (ECAM) and fuel prediction (FMGEC), and compare with the computerized flight plan or use the performance application of the EFB
- Check that there is no fuel leak
- Check that the sum of the Fuel On Board and the Fuel Used is consistent with the Fuel On Board at departure:
  - If the value is abnormally negative, suspect a fuel leak
  - If the value is abnormally positive, suspect a fuel quantity overread.

CAUTION	This check must also be performed each time a FUEL IMBALANCE procedure is necessary. Perform the check before applying the FUEL IMBALANCE procedure. If a fuel leak is confirmed, apply the FUEL LEAK procedure.

RADAR

RADAR.........................ADJUST AS APPROPRIATE | PF

Gain must be manually set to +4, when MULTISCAN sw is set to AUTO and when flying below FL 200.

Note:
1. *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt until displaying ground echoes*
2. *If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique*
3. *In particular below FL 200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to Manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display*
4. *In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and Manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.*

LANDING PERFORMANCE

LANDING CONDITIONS....................CONFIRM | PF-PM

Perform an in-flight landing performance assessment if the landing conditions changed compared with the landing distance computation at dispatch, or with a previous computation (e.g. runway, weather conditions, in-flight failure affecting performance, diversion).

L2 *For more information,Refer to FCTM/PR-NP-SOP-160 Landing Performance.*

L1 ● **If landing conditions changed:**

LANDING PERF DATA....................COMPUTE | PF-PM

L2 *The PF and the PM independently compute the landing distance performance data, based on the new conditions at arrival.*

L1 *Note:* *1. If the weather conditions are expected to change at the landing airport, or in the event of significant precipitation, the flight crew should consider a second calculation of the in-flight landing distance with the worst possible runway condition*
2. The selection of REV MAX is the standard practice for landing.
However, on DRY runways the flight crew may select REV IDLE.
On WET runways (runway surface condition GOOD), the flight crew may select REV IDLE, if all the following conditions are satisfied:

- *A landing distance assessment has been made with the following parameters:*
  - *MEDIUM TO POOR landing performance level for the in-flight landing distance computation*
  - *No reverser credit.*
- *The result of this landing distance assessment is within the LDA.*

LANDING PERF DATA...CROSSCHECK | BOTH

L2 *The PF and the PM compare their EFB to ensure that the computations are the same.*
For more information, Refer to FCTM/PR-NP-SOP-160 Content of a Landing Performance Data Crosscheck

FMS

ARRIVAL page.. COMPLETE/CHECK | PF

L2 *Insert APPR, STAR, TRANS and APPR VIA if applicable. (Access by lateral revision at destination).*

L1 F-PLN A page... CHECK | PF

L2
- *Check that the F-PLN agrees with the planned approach and missed approach*
- *Check the F-PLN (approach and Missed Approach tracks and distances) vs. the approach charts, using the ND in PLAN mode as necessary*
- *Check speed constraints. Add new speed constraints if required.*

- *Check altitude constraints. Add new altitude constraints if required.*

  Note: *The FMS may have deleted the altitude constraints that are at or above the CRZ FL, or at or above any previous lower CRZ FL in the case of step climbs (Refer to DSC-22_20-30-20-05 Vertical Constraints (Altitude)).*

  In that case:
  - *Insert again the affected procedures (STAR, APPR VIA or TRANS)*
    The FMS keeps the altitude constraints that are below the CRZ FL, and deletes again the altitude constraints that are above current CRZ FL. The FMS may also delete the altitude constraints that are at current CRZ FL, and the altitude constraint windows that have a constraint at or above current CRZ FL.
  - *Manually enter the altitude constraints that are below current CRZ FL using the MCDU Vertical Revision pages.*
    It is not possible to enter an altitude constraint at the CRZ FL.
    In the case of an "AT" or "AT OR ABOVE" altitude constraint at the CRZ FL, the flight crew must select the DES mode only after the aircraft reaches the position of the altitude constraint to prevent an early descent.

- *In all cases, do not modify the final approach (FAF to runway or MAP), including altitude constraints*
- *Identify the position and the altitude of Final Descent Point (FDP) and check the value of the FPA after this FDP*
- *If a TOO STEEP PATH message is displayed after the FDP, do not use FINAL APP guidance for approach*
- *Identify the Missed Approach Point.*

DES WIND page..CHECK PF

Enter winds for descent starting at cruise flight level.

Note: *With DPO ◁, as the idle thrust margins are reduced, accurate winds have to be entered to be able to follow the computed vertical profile and thus maximize the benefits of DPO ◁. Refer to DSC-22_20-60-160 Descent Profile Optimization (if installed).*

PERF CRUISE page...CHECK PF

Modify the cabin descent rate if different pressure rate is required.

PERF DES page...CHECK PF

Prior to descent, access PERF DES page and check MANAGED MACH/SPD
If a speed other than ECON is required, insert that MACH or SPD into the ECON field.

This new MACH and/or SPD is now the one for the descent path and T/D computation, and will be used for the managed speed descent profile (instead of ECON).

L2 *A speed limit of 250 kt below 10 000 ft is the defaulted speed in the managed speed descent profile. The flight crew may delete or modify it if necessary on the VERT REV at DEST page.*

Ident.: PRO-NOR-SOP-16-A-00020073.0001001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

PERF APPR page..COMPLETE/CHECK PF

- *Enter the QNH, temperature, and wind at destination.*

CAUTION	*During QFE operations, the flight crew must convert QFE into QNH. The CPC uses the QNH to compute the cabin pressurization profile. Therefore, the entry of QFE in QNH field of the PERF APPR page leads to an erroneous cabin pressurization profile.*

L12

Note: *Insert the average wind given by the ATC or ATIS. Do not insert the gust value. During approach, the Ground Speed Mini function (managed speed mode) takes into account the instantaneous gust.*
For more information, Refer to DSC-22_30-60-20 Ground Speed Mini Function.
For example, if the wind is 15020G35KT, insert 150/20.

- *Insert the minimum.*

Note: *To avoid undershooting the published minimum during go-around, due to aircraft inertia during pull-up, some Authorities may require Operators to add a specific number of feet to the published minimum.*

CAUTION	*If the QNH altimeter setting is used for an aircraft with the QFE option ◁ , Refer to DSC-22_20-85 QNH Use for Aircraft Equipped with QFE Option.*

Note: *Changing the RWY or type of arrival (VOR, ILS/ GLS ◁) automatically erases the previous minimum.*

Note: *After the activation of the SEC F-PLN, check the VAPP, and modify if necessary.*

- *Check or modify the landing configuration. Always select the landing configuration on the PERF APPR page:*
  - *CONF FULL or CONF 3 is the normal landing configuration. CONF 3 should be considered, depending on the available runway length and go-around performance, or if windshear/severe turbulence is considered possible during the approach.*
- *Check or modify the transition altitude/flight level.*

PERF GO AROUND page..CHECK/MODIFY PF

Applicable to: ALL

ANTI ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG 1 and 2 ANTI ICE pb-sw .... AS RQRD PM

L2 *Engine anti-ice must be set to ON before and during descent, even if the SAT is below -40 °C (-40 °F).*
With ENG ANTI ICE pb-sw ON, the FADEC automatically selects a higher idle thrust, which gives better protection against engine flame-out.

L1 WING ANTI ICE pb-sw .... AS RQRD PM

When icing conditions are encountered:
- The flight crew may turn on the wing anti-ice to prevent ice accretion on the wing leading edge
- The flight crew must turn on the wing anti-ice if there is evidence of ice accretion, such as ice on the visual indicators, or on the wipers, or with the SEVERE ICE DETECTED alert. This is to remove any ice accumulation on the wing leading edge.

ANTI ICE ON reduces the descent path angle (when the engines are at idle). The flight crew can compensate for this by increasing descent speed, or by extending up to half speedbrakes.

Ident.: PRO-NOR-SOP-16-A-00012252.0001001 / 09 NOV 21
Applicable to: ALL

DESCENT CLEARANCE

DESCENT CLEARANCE.. OBTAIN PM
CLEARED ALTITUDE ON FCU.. SET PF

L2 *When the flight crew obtains the ATC clearance, they should set the cleared altitude (FL) on the FCU taking into account the safe altitudes.*
If the lowest safe altitude is above the cleared altitude, check with the ATC to determine if this constraint applies.
If the ATC confirms that this constraint applies, set the safe altitude on the FCU until it is safe to reach the cleared altitude.

DESCENT INITIATION

Ident.: PRO-NOR-SOP-17-00011965.0001001 / 09 NOV 21
Applicable to: ALL

DESCENT INITIATION

DESCENT.. INITIATE | PF

L2 The standard method to initiate the descent is to engage the DES mode at the Top of Descent (T/D) computed by the FMS.

L1 For more information on T/D and profile computation, *Refer to FCTM/PR-NP-SOP-170 Computation Principles*.

■ **If ATC requires an early descent:**

Use the DES mode.

The DES mode guides the aircraft down to a lower vertical speed, in order to converge with the required descent path (The flight crew may use a V/S of 1 000 ft/min).

■ **If the descent is delayed by ATC:**

Beyond the T/D, the DECELERATE or T/D REACHED message appears on the PFD and MCDU. This suggests that the flight crew should reduce the speed toward green dot speed with ATC permission.

When cleared for descent, engage DES mode with the managed speed active.

DESCENT MONITORING

Ident.: PRO-NOR-SOP-17-00011966.0001001 / 09 NOV 21
Applicable to: ALL

DESCENT MONITORING

PF MCDU..PROG/PERF DES | PF

L2 *PF MCDU should be set to PROG or PERF DES page:*
- *PROG page in order to get VDEV information*
- *PERF DES in order to get predictions down to any inserted altitude in DES/OP DES modes.*

L1 PM MCDU.. F-PLN | PM
DESCENT.. MONITOR/ADJUST | PF

L2 *Refer to PRO-NOR-SRP-01-60 Descent Monitoring - DES Mode Engaged.*

- *When flying in NAV mode, use the DES mode.*
  - *Monitor the VERT DEV*
    The VERT DEV appears on the PFD and on the PROG page.
  - *Monitor the FMA when the aircraft reaches the level-off symbol (i.e.*  *or* *)*

  Note: *The NDs display a level-off symbol*  *along the flight path. The position of this symbol is based on the current active modes: i.e. AP/FD and A/THR.*

- *MCDU predictions assume a return to the lateral F-PLN and descent flight path.*
- *Note that whenever the lateral mode is changed from NAV to HDG/TRK the vertical mode reverts to V/S at the value pertaining at the time of the mode change.*
- *From time to time during stabilized descent, the flight crew may select FPA to check that the remaining distance to destination is approximately the altitude change required divided by the FPA in degrees.*
- *FPA (°) = Δ FL/DIST (NM)*

DESCENT ADJUSTMENT

Applicable to: ALL

Ident.: PRO-NOR-SOP-17-A-00011967.0001001 / 09 NOV 21

DESCENT ADJUSTMENT

RATE of DESCENT...ADJUST, AS RQRD | PF

L2 *To increase the rate of descent, increase the descent speed by using the selected speed, if comfort and the ATC permit. It is more cost-effective (Time/Fuel) than using the speed brakes:*

- *Maintain a high speed as long as possible, provided that the ATC permits to fly above the speed limits*
- *If the aircraft is high and at high speed, it is more efficient to keep the high speed until ALT* then to decelerate at level-off, instead of combining descent and deceleration*
- *If the aircraft goes below the desired profile, use the selected speed and the V/S mode to adjust the rate of descent.*

In the OP DES mode, the flight crew can use the speed brakes to increase the rate of descent. The flight crew can also use the speed brakes to maintain the required rate of descent, when engine anti-ice is used.
In the DES mode, if the aircraft is on, or below the flight path and the ATC requires a higher rate of descent, do not use the speed brakes because the rate of descent is imposed by the planned flight path. Therefore, the A/THR may increase thrust to compensate for the increase in drag. In this case, use the OP DES mode with speed brakes.

Ident.: PRO-NOR-SOP-17-A-00011971.0001001 / 15 NOV 21

TERRAIN ON ND

TERR ON ND....................AS RQRD | PF-PM

L2
- *In mountainous areas, consider displaying terrain on ND.*
- *If use of radar is required, consider selecting the radar display on the PF side, and TERR ON ND on the PM side only.*
- *If NAV ACCURACY is LOW, do not use the TERR on ND.*

Ident.: PRO-NOR-SOP-17-A-00011970.0002001 / 06 NOV 23

BAROMETRIC REFERENCE

- **When the aircraft approaches the transition level, and when cleared for an altitude:**
  BAROMETRIC REFERENCE....................SET/CROSSCHECK | BOTH

L2
- *Set QNH on the EFIS control panel and on the standby altimeter*
- *Crosscheck the barometric reference settings and the altitude indications.*

L1
Note: *The flight crew must take into account any QNH change on the EFIS control panels, standby altimeter and on the FMS PERF APPR page.*
The flight crew should pay attention to a barometric reference that significantly differs from the one used for approach preparation. That could be the symptom of a barometric reference error. In this case the flight crew should consider the confirmation of the barometric reference from all available sources.

Approach General

INTRODUCTION

Ident.: PRO-NOR-SOP-18-A-00014468.0001001 / 15 NOV 21
Applicable to: ALL

The APPROACH section provides the standard operating procedures for the following approach types:

- ILS / GLS ◁ approaches
- Conventional approaches: VOR, VOR-DME, NDB, NDB-DME
- Approaches based on a LOC signal without any G/S signal: LOC ONLY, ILS G/S OUT, LOC B/C
- RNAV approaches including:
  - RNAV(GNSS) approaches with LNAV or LNAV/VNAV minima (with FLS ◁)
  - RNAV(GNSS) approaches with LPV or LP minima (with SLS ◁)
  - RNAV(RNP) approaches for which Authorization is Required (AR).

Note: *In relation to the names in the ICAO Performance-Based Navigation (PBN) Manual:*
- *"RNP APCH operations" corresponds to RNAV(GNSS) approaches*
- *"RNP AR APCH operations" corresponds to RNAV(RNP) approaches.*

CROSS-REFERENCE TABLE

Ident.: PRO-NOR-SOP-18-A-00014469.0001001 / 15 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP

This table provides Guidance Modes that may be used depending on the Approach Types.

FLYING REFERENCE

Ident.: PRO-NOR-SOP-18-A-00014470.0001001 / 29 MAY 13
Applicable to: ALL

Use the following recommended flying reference:
- In vertical managed modes: HDG-V/S reference associated with the FD crossbars
- In vertical selected modes: TRK-FPA reference associated with FPD.

STABILIZATION CRITERIA

Ident.: PRO-NOR-SOP-18-A-00014471.0001001 / 04 DEC 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The stabilization height is defined as one of the following:
- 1 000 ft above airfield elevation (AAL) in Instrument Meteorological Conditions (IMC), or
- 500 ft above airfield elevation (AAL) in Visual Meteorological Conditions (VMC), or
- Any other height defined in Operator policies or regulations.

In order for the approach to be stabilized, all of the following conditions must be satisfied before, or at the stabilization height:
- The aircraft is on the correct lateral and vertical flight path
- The aircraft is in the desired landing configuration
- The thrust is stabilized, usually above idle, and the aircraft is at target speed for approach

Note: *In IMC, a later speed and thrust stabilization can be acceptable provided that:*
- *It is in accordance with Operator policies and regulations*
- *The aircraft is in deceleration toward the target approach speed*
- *The flight crew stabilizes speed and thrust as soon as possible and not later than 500 ft AAL.*

- The flight crew does not detect any excessive flight parameter deviation.

If one of the above-mentioned conditions is not satisfied, the flight crew must initiate a go-around, unless they estimate that only small corrections are required to recover stabilized approach conditions.

STABILIZATION CRITERIA

Ident.: PRO-NOR-SOP-18-A-00014471.0003001 / 04 DEC 18
Applicable to: LV-GKO, LV-GKP

The stabilization height is defined as one of the following:
- 1 000 ft above airfield elevation (AAL) in Instrument Meteorological Conditions (IMC), or
- 500 ft above airfield elevation (AAL) in Visual Meteorological Conditions (VMC), or
- Any other height defined in Operator policies or regulations.

In order for the approach to be stabilized, all of the following conditions must be satisfied before, or at the stabilization height:
- The aircraft is on the correct lateral and vertical flight path
- The aircraft is in the desired landing configuration

- The thrust is stabilized, usually above idle, and the aircraft is at target speed for approach

  Note: *In IMC, a later speed and thrust stabilization can be acceptable provided that:*
  - *It is in accordance with Operator policies and regulations*
  - *The aircraft is in deceleration toward the target approach speed*
  - *The flight crew stabilizes speed and thrust as soon as possible and not later than 500 ft AAL.*
- The flight crew does not detect any excessive flight parameter deviation.

If one of the above-mentioned conditions is not satisfied, the flight crew must initiate a go-around, unless they estimate that only small corrections are required to recover stabilized approach conditions.

Note: *If the forecasted tailwind at landing is greater than 10 kt, decelerated approach is not allowed, and the speed should be stabilized around VREF +5 kt in final.*

APPROACH SPEED TECHNIQUE

Ident.: PRO-NOR-SOP-18-A-00014472.0001001 / 24 NOV 23
Applicable to: ALL

DECELERATED APPROACH

The decelerated approach with FD or AP/FD guidance is the standard flying technique for ILS / GLS approaches and approaches using FLS , SLS , or FINAL APP guidance.

EARLY STABILIZED APPROACH

Under certain circumstances, the flight crew may decide to reduce the speed down to VAPP in the landing configuration by the FDP (approach via selected guidance, high glide path angle, low altitude intermediate approach, etc.). In order to obtain a valuable deceleration pseudo waypoint and to ensure a timely deceleration, the flight crew should enter VAPP as a speed constraint at the FDP.

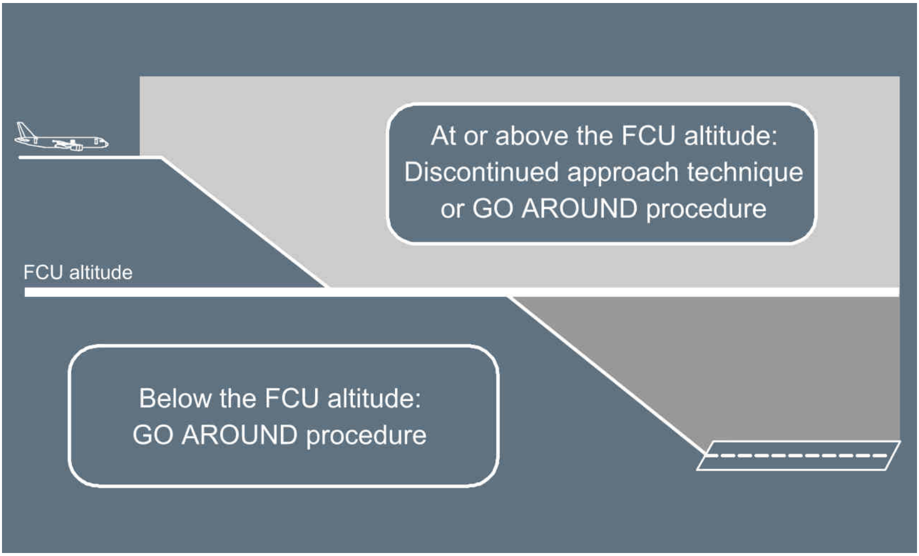
DISCONTINUED APPROACH

Ident.: PRO-NOR-SOP-18-A-00015153.0001001 / 15 NOV 21
Applicable to: ALL

In order to discontinue an approach when the aircraft is at or above the altitude selected on the FCU, the flight crew can either:

- Apply the GO AROUND procedure, or
- Apply the discontinued approach technique.

When the aircraft is below the FCU altitude, the flight crew must apply the GO AROUND procedure.



At or above the FCU altitude:
Discontinued approach technique
or GO AROUND procedure
FCU altitude
Below the FCU altitude:
GO AROUND procedure

- **If at or above the FCU altitude:**

  Announce "CANCEL APPROACH".

  To disarm any AP/FD approach mode, press APPR pb or LOC pb.

  Note: *Valid only for ILS / GLS ◁ / FLS ◁ / SLS ◁ or FINAL APP guidance.*

  Select lateral mode as required (NAV or HDG mode).

  Select vertical mode as required (level off or adjust V/S).

  Select SPEED and adjust.

- **If F-PLN has no destination anymore:**

  Perform a LAT REV at the last waypoint and redefine the destination in the NEW DEST field.

  Note: 1. *The FMS does not automatically string the previous flown approach in the active F-PLN when the aircraft overflies the last waypoint. The FMS has no more destination in the F-PLN.*
  2. *Because the thrust levers are not set to TOGA detent, the FMS remains in approach phase.*

Intentionally left blank

Aircraft Configuration Management

INITIAL APPROACH

Ident.: PRO-NOR-SOP-18-B-A-00014474.0001001 / 29 MAY 13
Applicable to: ALL

GENERAL

The initial approach procedure described here is a general guidance whatever the type of approach expected.

Ident.: PRO-NOR-SOP-18-B-A-00014475.0001001 / 09 NOV 21
Applicable to: ALL

INITIAL APPROACH

F-PLN SEQUENCING....................ADJUST | PF

L2
- *A good clue to monitor the proper F-PLN sequencing is the TO waypoint on the upper right side of the ND, which should remain meaningful*
- *In NAV mode, the F-PLN will sequence automatically*
- *In HDG or TRK mode, the F-PLN will sequence automatically only if the aircraft flies close to the F-PLN route.*

L1 APPROACH PHASE....................CHECK/ACTIVATE | BOTH

L2
- *If the aircraft overflies the DECEL pseudo waypoint in NAV mode, the APPR phase activates automatically*
- *If the aircraft is in HDG or TRK mode, approximately 15 NM from touchdown activate and confirm APPR phase on the PERF DES page.*

L1 MANAGED SPEED....................CHECK | PF

L2 *If ATC requires a particular speed, use selected speed. When the ATC speed constraint no longer applies, return to managed speed.*

L1 FLIGHT PATH....................MONITOR | PF

L2
- *In NAV mode, use V/DEV information on the PFD and PROG page*
- *In HDG or TRK mode, use the energy circle on ND representing the required distance to land.*

L1 SPEED BRAKES lever...AS RQRD | PF

L2
- *If the flight crew uses the speed brakes to increase the rate of deceleration or to increase the rate of descent, the VLS will increase as well:*
  - *The flight crew should ensure that appropriate speed margin exists before the extension of the speed brakes*
  - *If the speed brakes are extended, the flight crew should ensure that appropriate speed margin exists before the beginning of a turn.*

  This will avoid the activation of the Alpha-Floor protection.

Ident.: TDU / PRO-NOR-SOP-18-B-A-00014535.0005001 / 09 NOV 21
Applicable to: LV-GKP
Impacted DU: 00014476 Initial Approach - Radar

RADAR

RADAR...ADJUST AS APPROPRIATE | PF

L2
- *Gain must be manually set to +4, when MULTISCAN sw is set to AUTO and when flying below FL 200*
- *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt until displaying ground echoes*
- *If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use MANUAL TILT according to standard techniques*
- *In particular below FL 200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to MANUAL mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display*
- *In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and MANUAL modes to display lower targets of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.*

NAVIGATION ACCURACY

- **If GPS PRIMARY LOST:**

NAVIGATION ACCURACY............MONITOR | PM

L2 *Check on FMS PROGRESS page that the required navigation accuracy is appropriate according to the flown airspace. For more information, Refer to PRO SPO 51 PBN.*

INTERMEDIATE/FINAL APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-18-B-B-00014479.0001001 / 29 MAY 13

GENERAL

The intermediate and final approach procedure described here is a general guidance whatever the type of approach expected.

Ident.: PRO-NOR-SOP-18-B-B-00014480.0001001 / 09 NOV 21

AT GREEN DOT SPEED

CAUTION	The flight crew should avoid extended flight in icing conditions with the slats extended.

FLAPS 1............ORDER | PF
FLAPS 1............SELECT | PM

L2
- *FLAPS 1 should be selected more than 3 NM before the Final Descent Point*
- *Check the aircraft deceleration toward S speed*
- *For decelerated approaches, the aircraft must reach or be established on the final descent with FLAPS 1 and S speed at or above 2 500 ft AGL*
- *If the aircraft does not decelerate on the flight path or aircraft speed is significantly higher than S speed, extend the landing gear in order to slow down. The use of speed brakes is possible. However, the flight crew should be aware that the use of speed brakes causes an increase in VLS.*

L1 TCAS Mode selector............TA or TA/RA | PM

L2 *FAA recommends to select TA only mode:*
- *In case of known nearby traffic which is in visual contact*
- *At particular airports and during particular procedures identified by an Operator as having a significant potential for unwanted or inappropriate resolution advisories (e.g. closely-spaced parallel runways, converging runway, low terrain along the final approach, etc.).*

Ident.: PRO-NOR-SOP-18-B-B-00014481.0001001 / 15 NOV 21

AT 2500 FT AGL MINIMUM

FLAPS 2	ORDER	PF
FLAPS 2	SELECT	PM

L2
- *Check the aircraft deceleration toward F speed*
- *For ILS, GLS ◁ , SLS ◁ , FLS ◁ , if the aircraft intercepts the flight path below 2 500 ft AGL (2 000 ft AGL minimum), select FLAPS 2 at one dot below the flight path*
- *If the aircraft speed is significantly higher than F speed on the flight path, or the aircraft does not decelerate on the flight path, extend the landing gear in order to slow down the aircraft. The use of speed brakes is not recommended*
- *When the speed brakes are deployed, extending the FLAPS beyond FLAPS 1 may induce a slight roll movement, and in calm conditions a small lateral control asymmetry may remain until disturbed by a control input or by an atmospheric disturbance.*

Ident.: PRO-NOR-SOP-18-B-B-00014482.0001001 / 24 NOV 23

WHEN FLAPS ARE AT 2

L2 *Check CABIN READY in the EWD, or obtain the cabin report from the purser.*

L1 LANDING C/L....................COMPLETE | PF-PM
CABIN CREW....................ADVISE | PM

L2 *Advise the cabin crew that landing is imminent.*

L1 FLIGHT PARAMETERS....................MONITOR | PM

L2
- *The PF announces any FMA modification*
- *The PM calls out, if:*
  - *The speed goes lower than the speed target -5 kt, or more than the speed target +10 kt*
  - *The pitch attitude goes lower than 0 °, or more than +10 ° nose up*
  - *The bank angle becomes more than 7 °*
  - *The descent rate becomes more than 1 200 ft/min.*
- *Following PM flight parameter exceedance callout, the suitable PF response will be:*
  - *Acknowledge the PM callout, for proper crew coordination purposes*
  - *Take immediate corrective action to control the exceeded parameter back into the defined stabilized conditions*
  - *Assess whether stabilized conditions will be recovered early enough prior to landing, otherwise initiate a go-around.*

For xLS, one Dot below the Glide
Brakes (When Required)
1000 ft AGL (3)
VAPP Stable
LDG Config
Touchdown
Reverse
REV IDLE

Note: *This approach assumes the use of managed speed.*

If not, select speed manually:
S after FLAPS 1 selection
F after FLAPS 2 selection
VAPP after LDG FLAPS selection.

Note: *If earlier stabilization at VAPP is required, start deceleration at higher altitude.*

Note:
1. *The change in FLAPS setting is almost continuous and takes into account the extension time of the surfaces. However, the flight crew must consider VFE NEXT that appears on the PFD in some cases (e.g. heavy aircraft).*
2. *To minimize FLAPS wear, extend FLAPS at VFE -15 kt when possible.*
3. *1 000 ft AGL minimum IMC, 500 ft AGL minimum VMC, or in accordance with the airline policy and regulations.*

Aircraft Guidance Management

APPROACH USING LOC G/S GUIDANCE

Applicable to: ALL

Ident.: PRO-NOR-SOP-18-C-A-00014487.0001001 / 15 NOV 21

GENERAL

The following items are to be performed in addition to previous SOP chapters for approach flown with ILS / GLS ◁✳ / SLS ◁✳ .

Ident.: PRO-NOR-SOP-18-C-A-00020760.0001001 / 09 NOV 21

DESCENT PREPARATION

APPROACH MINIMUM....................DETERMINE | PF

L2 - *For CAT II, CAT III, approaches, always choose the lowest achievable minimum. The approach minimum is limited by:*
  - *Crew qualification*
  - *Airline Operating Manual requirement*
  - *Aircraft technical status*
  - *Airport status*

- *For CAT III with no DH, the flight crew should enter NO in the DH field of the MCDU to avoid false "HUNDRED ABOVE" or "MINIMUM" auto callouts which would not be applicable.*

L1 ARRIVAL BRIEFING....................PERFORM | BOTH

L2 *For CAT II, CAT III, approaches, review the following items on top of the usual briefing:*
- *Task sharing and callouts*
- *Management of degraded guidance*
- *Low visibility procedures at the airport.*

Ident.: PRO-NOR-SOP-18-C-A-00014488.0001001 / 09 NOV 21

INITIAL/INTERMEDIATE APPROACH

APPR pb on FCU	PRESS	PF

L2 - *Press the APPR pb when all of the following is applicable:*

- *The aircraft is cleared for the approach*
- *The aircraft is on the intercept trajectory for the final approach course*
- *LOC deviation is available on the PFD.*

This arms the LOC and G/S modes

- *LOC and/or G/S capture modes will engage no sooner than 3 s after being armed.*

L1 *Note: In NAV mode, the aircraft may leave the F-PLN to capture the LOC.*

L3 *ICAO defines the envelope where the quality of the G/S signal ensures a normal capture. This envelope is within 10 NM , ±8 ° of the centerline of the ILS glide path and up to 1.75 Θ and down to 0.3 Θ (Θ = nominal glide path angle). When arming the approach well outside of the normal G/S capture envelope, a spurious G/S* engagement may occur due to a wrong G/S deviation signal. Whenever the flight crew notices the pitch movement, or the spurious G/S*, or the trajectory deviation, the flight crew will immediately disconnect the AP, if engaged, to re-establish a normal attitude and will disengage APPR mode. It is then recommended to arm/rearm APP (ILS) mode within the normal capture zone.*

L1

BOTH APs	ENGAGE	PF

L2

- *When APPR mode is selected, AP1 and AP2 should be engaged*
- *Above 5 000 ft AGL, the FMA displays CAT 1*
- *Below 5 000 ft AGL, the FMA displays the correct approach capability for the intended approach.*

MANAGEMENT OF DEGRADED GUIDANCE

EARLY/UNTIMELY FLARE MODE ENGAGEMENT

- Perform a go-around (thrust levers set to TOGA), or
- Disconnect AP, set both FDs to OFF and continue the approach using raw data or external visual references.

In association to an early/untimely FLARE mode engagement on the FMA, the following effects may occur:

- On the PFD:
  - The RA height indication may be frozen at a positive or negative value
  - Discrepancies between both PFDs may happen on the following indications:
    - RA heights
    - FD orders
    - FMA indications when both APs are engaged.
- Warnings and/or Callouts:
  - Untimely activation of the AUTOLAND warning (*Refer to DSC-22_30-80-10 AUTOLAND Light*)
  - Untimely TAWS alerts
  - Untimely or absence of “RETARD” callout
  - Untimely L/G GEAR NOT DOWN alert
  - Absence or interruption of RA automatic callout (height announcement).
- On the SD: A pulsing cabin differential pressure advisory may appear on the CAB PRESS SD page.

Note: *This ECAM advisory has no consequence on the real cabin pressure.*

FOR CAT II, CAT III APPROACHES:

- **Apply the following strategy in the case of:**
  - Amber caution (single chime), or
  - Landing capability degradation below the approach category defined during the briefing.

- **Above 1 000 ft AGL:**

ECAM/QRH PROCEDURE	COMPLETE	BOTH
APPROACH AND LANDING CAPABILITY	CHECK	BOTH
REQUIRED EQUIPMENT	CHECK	PM

DESCENT PREPARATION

WEATHER AND LANDING INFORMATION....................OBTAIN | PM

L2 - *The FMS vertical profile does not take into account the effect of low OAT. Therefore, vertical managed guidance:*

- *Must not be used when the actual OAT is below the minimum temperature indicated on the approach chart or defined by the Operator, or*
- *May not be used when temperature corrections are required (FINAL APP mode may not engage)*

- *For RNAV (GNSS) approach with LNAV VNAV minima, use of QNH from a remote station is prohibited.*

L1 F-PLN A page....................CHECK | PF-PM

L2 - *If a TOO STEEP PATH is displayed after the FDP, do not use FINAL APP guidance for approach. Use NAV FPA, TRK FPA or FLS for approach*
- *0.1 degree of difference between the MCDU and the charted final vertical path is acceptable*
- *1 degree of difference between the MCDU and the charted final lateral track is acceptable.*

Note: *A higher lateral track value can be acceptable if the navigation database has been validated to exclude potential coding error*

- *3 degree of difference between the MCDU and the charted final lateral track is acceptable for conventional radio NAVAID approach.*

L1 PROG page....................COMPLETE | PF-PM

L2 *Insert the reference RWY threshold in the BRG/DIST field for position monitoring during approach.*

L1 GO-AROUND STRATEGY....................REVIEW | PF

L2 *The briefing should include a review of the "Management of Degraded Navigation" chapter.*

MANAGEMENT OF DEGRADED NAVIGATION

- **For VOR and NDB approaches, be prepared to continue the approach with reference to appropriate raw data by reverting to:**
  - NAV-FPA, if the vertical guidance is not satisfactory
  - TRK-FPA, if the lateral guidance is not satisfactory.
- **For RNAV(GNSS) approaches with LNAV minima:**
  - Use the appropriate remaining AP/FD in the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one ND.
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE
    - NAV ACCUR DOWNGRAD on both NDs.
  - Be prepared to continue the approach by reverting to NAV-FPA, if the vertical guidance is not satisfactory.

- **For RNAV(GNSS) approaches with LNAV/VNAV minima:**
  - Use the appropriate remaining AP/FD in the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one ND.
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE
    - NAV ACCUR DOWNGRAD on both ND.
  - Discontinue the approach in the case of deviation of 75 ft below the vertical path (V/DEV > ¾ dot).

APPROACH USING FINAL APP GUIDANCE FOR RNAV(RNP)

Ident.: PRO-NOR-SOP-18-C-D-00014542.0002001 / 29 MAY 13
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

GENERAL

The following items are to be performed in addition to previous SOP chapters in case of RNAV(RNP) approaches.
The procedures of the paragraph below are generic guidelines for RNAV(RNP) approaches. These procedures may be tailored by the airline for specific airfields according to their OPS approval.

Ident.: PRO-NOR-SOP-18-C-D-00014543.0002001 / 01 MAR 18
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

AIRCRAFT EQUIPMENT

Refer to PRO-SPO-51 RNP AR / RNAV(RNP) - General

Ident.: PRO-NOR-SOP-18-C-D-00014544.0002001 / 29 MAY 13
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

FLIGHT PREPARATION

Use a prediction tool to check the GPS PRIMARY availability for the estimated time of operation. It ensures that the RNP criteria will be met during approach. This prediction should take into account the terrain environment.

Ident.: PRO-NOR-SOP-18-C-D-00014546.0002001 / 09 NOV 21
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

DESCENT PREPARATION

WEATHER AND LANDING INFORMATION...OBTAIN | PM

L2
- *The FMS vertical profile does not take into account the effect of low OAT. Therefore, vertical managed guidance:*
  - *Must not be used when the actual OAT is below the minimum temperature indicated on the approach chart or defined by the Operator, or*
  - *May not be used when temperature corrections are required (FINAL APP mode may not engage)*
- *Verify that wind is within limits*

DESCENT

GPS PRIMARY ON BOTH FMS...CHECK | PF

L2 *For RNAV(RNP) approaches, GPS PRIMARY must be available on both FMS (GPS PRIMARY LOST is not displayed on NDs).*

L1 GPS 1+2...CHECK both in NAV or SBAS ◁ | PF

L2
- *Both GPS must be in NAV or SBAS ◁ on the GPS MONITOR page*
- *Both GPS and both FMS must be available, before the IAF. Therefore, if one FMS is inoperative or if one GPS is not in NAV or SBAS ◁ before the IAF, RNAV(RNP) is not permitted.*

L1 TERR ON ND...ON | PF-PM

L2 *Unless weather radar is required on one side, the flight crew selects terrain on both NDs.*

Ident.: PRO-NOR-SOP-18-C-D-00014548.0006001 / 24 NOV 23
Applicable to: LV-KAN, LV-KAO

INITIAL / INTERMEDIATE / FINAL APPROACH

BAROMETRIC REFERENCE....................SET/CROSSCHECK | PF-PM

L2 *The vertical guidance requires a precise BARO setting. The maximum acceptable difference between altimeters is 100 ft.*

L1 FD or AP/FD....................USE FOR APPROACH | PF

L2
- *The use of FD or AP/FD provides the required navigation accuracy.* *Refer to LIM-AFS-10 Use of NAV Mode - Approach Based on Radio Navaids*
- *For operations with RNP below 0.3 NM, one AP must be engaged.*

L1 L/DEV....................CHECK DISPLAYED | PF

L2 *Check that the L/DEV scale is displayed on the PFD.*

L1 APPR pb on FCU....................PRESS | PF

L2 *Press the APPR pb when all of the following conditions are satisfied:*
- *The aircraft is cleared for approach*
- *TO waypoint is the final descent point.*

L1 APP NAV....................CHECK ARMED or ENGAGED | PF
FINAL....................CHECK ARMED | PF

L2
- *Check that the V/DEV scale is displayed on the PFD*
- *At the VIP, a blue arrow on ND indicates that FINAL APP engagement conditions are met.*

L1

At the Final Descent Point:

FINAL APP....................CHECK ENGAGED | PF
GO-AROUND ALTITUDE....................SET | BOTH
FLIGHT PARAMETERS....................MONITOR | PM

L2
- *Monitor L/DEV on PFD and XTK on ND*
- *Monitor V/DEV on PFD*
- *Check altitude crossing at FAF and waypoints of the final, as published on the chart*

- *The PM calls out if excessive deviation occurs:*
  - *L/DEV reaches ½ dot*
  - *V/DEV reaches ½ dot.*
    On the vertical scale, one dot corresponds to 100 ft. Therefore, ½ dot is 50 ft.

  Refer to PRO-NOR-SCO Approach
- *Go-around must be initiated if excessive deviation occurs:*
  - *L/DEV reaches 1 RNP*
  - *V/DEV reaches ¾ dot below the vertical profile.*
    On the vertical scale, one dot corresponds to 100 ft. Therefore, ¾ dot is 75 ft.

MANAGEMENT OF DEGRADED NAVIGATION

- **For VOR and NDB approaches in NAV-FPA, if the lateral guidance is not satisfactory:**
  - Be prepared to continue the approach with reference to appropriate raw data by reverting to TRK-FPA.
- **For RNAV(GNSS) approaches with LNAV minima:**
  - Use the appropriate remaining AP/FD in the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one ND.
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE
    - NAV ACCUR DOWNGRAD on both NDs.

CIRCLING APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-18-C-F-00014502.0001001 / 29 MAY 13

GENERAL

The circling approach is the visual phase of an instrument approach to bring an aircraft into position for landing on a runway which is not suitably located for a straight-in approach.

CAUTION	The flight crew must conduct the flight within the circling area, while maintaining required visual references at all times.

Ident.: PRO-NOR-SOP-18-C-F-00014503.0001001 / 24 NOV 23

APPROACH PREPARATION

For a circling approach, the approach preparation should include the following additional items in the FMS programming:

F-PLN

INSTRUMENT APPROACH....................INSERT | PF

L2 *On the ARRIVAL page, insert the instrument approach preceding the circling.*

L1 F SPEED CONSTRAINT AT FAF....................INSERT | PF

L2 *Insert F speed as constraint at FAF since the circling approach will be flown in CONF 3, landing gear down and F speed.*

L1 SEC F-PLN

F-PLN....................COPY ACTIVE | PF

L2 *On the SEC INDEX page, select COPY ACTIVE in order to make a copy of the active F-PLN.*

L1 LANDING RUNWAY....................REVISE | PF

L2
- *On the SEC F-PLN ARRIVAL page, insert the appropriate landing runway*
- *Keep the F-PLN discontinuity.*

Ident.: PRO-NOR-SOP-18-C-F-00014504.0001001 / 24 NOV 23

INSTRUMENT APPROACH

The flight crew flies an early stabilized approach at F speed, configuration 3 and landing gear down.

Ident.: PRO-NOR-SOP-18-C-F-00014505.0001001 / 24 NOV 23

CIRCLING APPROACH

- **At the Circling MDA(H) at the latest:**
  LEVEL OFF....................PERFORM | PF
- **At MAP, if the flight crew does not obtain required visual references:**
  GO AROUND....................PERFORM | PF
- **If the flight crew obtains required visual references:**
  TRK FPA....................SELECT | PF

  L2 *Select a track 45 ° away from the final approach course (or as required by the published procedure).*

  L1
  - **When wings are level:**
    CHRONO....................START | PF
  - **After 30 s:**
    DOWNWIND TRACK....................SELECT | PF

    L2 *Select the downwind track parallel to the landing runway.*

L1
- **During the downwind leg:**

  ACTIVATE SEC F-PLN.. ORDER | PF
  SEC F-PLN.. ACTIVE | PM

  - **When the aircraft is abeam the landing runway threshold:**

    CHRONO.. START | PM

L2 *The time from abeam threshold to the beginning of the base turn depends on the height above touchdown approximately 3 s/100 ft.*

L1 BASE TURN.. PERFORM | PF

L2 *Initially maintain 25 ° bank angle and maintain the altitude until the visual references for the intended runway are distinctly visible and identifiable.*

L1
- **When appropriate:**

  FLAPS FULL.. ORDER | PF
  FLAPS FULL.. SELECT | PM

- **When the aircraft is fully configured for landing:**

  LANDING C/L.. COMPLETE | PF-PM

- **At the latest before starting the descent toward the runway:**

  AP.. OFF | PF
  FDs OFF.. ORDER | PF
  FDs.. OFF | PM

- **At anytime during the circling procedure, if the required visual references are lost:**

  GO AROUND.. PERFORM | PF

L2 *Initiate a go-around following the missed approach of the initial instrument approach (unless otherwise specified).*

RNAV VISUAL APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-18-C-G-00015946.0001001 / 23 DEC 14

GENERAL

The aircraft navigates using the RNAV system, but the position is monitored by visual reference to the ground, obstacles and other traffic.
RNAV visual approach must be stored and retrievable from the Navigation Database.

Ident.: PRO-NOR-SOP-18-C-G-00015947.0001001 / 23 DEC 14

EQUIPMENT REQUIRED

- 1 FMS
- 1 GPS or 2 DME to update FM position
- Additional requirement if indicated on the approach chart.

Ident.: PRO-NOR-SOP-18-C-G-00015949.0001001 / 17 MAR 17

FMGEC GUIDANCE MODE

- **If no required accuracy is published:**

  The use of FMGEC guidance mode is at flight crew discretion.

- **If RNAV 1 or RNP 1 is required on the published approach chart:**

  The flight crew should use adequate FMGEC guidance modes.

Note: *The use of lateral and vertical managed guidance modes reduces the crew workload and improves energy management.*

For RNAV VISUAL approach including RF legs, *Refer to FCTM/PR-NP-SP-30 General*for RF leg flying technic.

Ident.: PRO-NOR-SOP-18-C-G-00015950.0001001 / 23 DEC 14

DESCENT PREPARATION

For approach data insertion in the FMS, keep the BARO/MDA field empty on the PERF APPR Page.

Ident.: PRO-NOR-SOP-18-C-G-00015951.0001001 / 23 DEC 14

DESCENT

For RNAV VISUAL approaches requiring GPS, check that GPS PRIMARY is available on at least 1 FMS.

Ident.: PRO-NOR-SOP-18-C-G-00015952.0001001 / 21 MAR 17

FINAL APPROACH

The flight crew must disconnect the AP at the latest at the Minimum Use Height of the AP.
Refer to LIM-AFS-10 Autopilot Function

VISUAL APPROACH

Ident.: PRO-NOR-SOP-18-C-H-00014507.0001001 / 24 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

GENERAL

Perform the approach on a nominal 3 ° glideslope using visual references. Approach is to be stabilized by 500 ft AAL on the correct approach path, in the landing configuration, at VAPP.

Method:
- The autopilot is not used
- Both FDs are OFF
- The use of FPV is recommended
- The use of A/THR is recommended with managed speed.

Keep in mind the possible risk of optical illusions due to hindered night vision.

Ident.: PRO-NOR-SOP-18-C-H-00014507.0003001 / 24 NOV 23
Applicable to: LV-GKO, LV-GKP

GENERAL

Perform the approach on a nominal 3 ° glideslope using visual references. Approach is to be stabilized by 500 ft AAL on the correct approach path, in the landing configuration, at VAPP.

Method:
- The autopilot is not used
- Both FDs are OFF
- The use of FPV is recommended
- The use of A/THR is recommended with managed speed.

Keep in mind the possible risk of optical illusions due to hindered night vision.

Note: *If the forecasted tailwind at landing is more than 10 kt decelerated approach is not allowed, and the speed should be stabilized around VREF + 5 kt in final.*

Ident.: PRO-NOR-SOP-18-C-H-00014508.0001001 / 08 AUG 13
Applicable to: ALL

INITIAL/INTERMEDIATE APPROACH

The flight plan selected on the MCDU should include the selection of the landing runway.
The downwind leg may also be part of the flight plan. This may be a useful indication of the aircraft position in the circuit on the ND.
However, visual references must be used.

Therefore, at the beginning of the downwind leg:
- Manually ACTIVATE APPR
- Select FDs to OFF
- Select TRK FPA to have FPV displayed
- Check A/THR active.
  Extend the downwind leg to 3 s/100 ft (±1 s/1 kt of headwind / tailwind).
  Turn into base leg with a maximum of 30 ° of bank. Descent with approximate FPA, in FLAPS 2, at "F" speed.

Ident.: PRO-NOR-SOP-18-C-H-00014509.0001001 / 24 NOV 23
Applicable to: ALL

FINAL APPROACH

The speed trend arrow and FPV help the flight crew make timely and correct thrust settings (if in manual thrust), and approach path corrections.
Avoid descent through the correct approach path with idle thrust (late recognition of this situation without a prompt thrust increase may lead to considerable speed decay and altitude loss).
Ensure that the aircraft is stabilized on the final descent path at VAPP (or ground speed mini) in the landing configuration with the thrust stabilized (usually above idle) at 500 ft AAL or as restricted by Operator policies/regulations.
If the aircraft is not stabilized, the flight crew must initiate a go around, unless they think that only small corrections are necessary to rectify minor deviations from stabilized conditions due, amongst others, to external perturbations.
Avoid any tendency to “duck under” in the late stages of the approach.
Avoid destabilizing the approach in the last 100 ft AGL, in order to have the best chance of performing a good touchdown at the desired position.

AT TOUCHDOWN

- **As soon as the main landing gear touches down:**

DEROTATION	INITIATE	PF
ALL REVERSER LEVERS	REV MAX or REV IDLE	PF

L2 *The flight crew must select reverse thrust immediately after main landing gear touchdown.*

L1 *Note: As soon as the flight crew selects reverse thrust, they must perform a full-stop landing.*

The flight crew must immediately select REV MAX, if any of the following occurs at any time during the landing:
- *An emergency*
- *The deceleration is not as expected*
- *A failure affects the landing performance*

- *A long flare or a long touchdown*
- *An unexpected tailwind.*

A small pitch up may occur during thrust reversers deployment before nose landing gear touchdown. However, the flight crew can easily control this pitch up.

GND SPLRS ....CHECK/ANNOUNCE | PM

L2
- *Check that the ECAM WHEEL SD page displays the ground spoilers extended after touchdown*
- *If no ground spoilers are extended:*
  - *Check that all thrust levers are set to IDLE detent*
  - *Set both thrust reverser levers to MAX REV, and fully press the brake pedals.*

L1 *Note: If ground spoilers are not armed, ground spoilers extend at reverse thrust selection.*

REVERSERS ....CHECK/ANNOUNCE | PM

L2
- *Check that the ECAM E/WD page displays the expected reverser deployment (i.e. REV)*
- *If reverser(s) do not deploy as expected, one of the main deceleration means is lost. The flight crew should consider adapting the available deceleration means to stop the aircraft.*

L1 DIRECTIONAL CONTROL....................ENSURE | PF

L2
- *Ensure directional control. Use the rudder pedals for directional control.*
- *During rollout, avoid sidestick inputs (either lateral or longitudinal)*
- *If the flight crew encounters directional control problem, they should reduce the thrust to REV IDLE until directional control is acceptable.*

L1 *Do not use the nosewheel steering control handle before reaching taxi speed.*

● **If autobrake is selected:**

AUTO BRK....................CHECK/ANNOUNCE | PM

L2 *Check and announce BRK LO or BRK MED on the FMA.*
If no ground spoilers are extended, the autobrake is not activated.

END OF ROLL OUT

ALL REVERSER LEVERS...STOW | PF

L2 *When the aircraft reaches the taxi speed, and before it leaves the runway, stow the reversers.*

L1

CAUTION	*Except in an emergency, do not use the reverse thrust to control the aircraft speed while on taxiways.*

L2 *On taxiways, the use of reversers, even restricted to idle thrust, would have the following effects:*
- *The engines may ingest fine sand and debris that may be detrimental to the engines and airframe systems*
- *On snow-covered areas, snow will recirculate into the air inlet, and may cause an engine flameout or rollback.*

L1 AP.. OFF | PF

L2 *Disengage the APs at the end of the roll out (before leaving the runway at the latest).*

GO AROUND

Ident.: PRO-NOR-SOP-20-A-00011082.0008001 / 09 NOV 21
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

Simultaneously apply the following three actions:

THRUST LEVERS	TOGA	PF

L2 *If TOGA thrust is not required, set the thrust levers to TOGA detent then retard the thrust levers as required. This enables to engage the GO-AROUND phase, with associated AP/FD modes.*
The flight crew may use CL detent to have benefit of A/THR.

L1 *Note: If the thrust levers are not set briefly to TOGA detent, the FMS does not engage the GO AROUND phase, and flying over, or close to the airport (less than 7 NM) will sequence the Destination waypoint in the F-PLN.*

ROTATION	PERFORM	PF

L2 *Initiate rotation towards 15 ° of pitch with all engines operative (approximately 12.5 ° if one engine is out) to get a positive rate of climb then follow SRS Flight Director pitch orders.*
When near the ground, avoid excessive rotation rate in order to prevent a tail strike.

L1

GO AROUND	ANNOUNCE	PF
FLIGHT PARAMETERS	MONITOR	PM
FLAPS	RETRACT ONE STEP	PM
FMA	CHECK/ANNOUNCE	PF

L2 *The following modes are displayed: MAN TOGA / SRS / GA TRK or NAV / A/THR.*
Depending on the guidance modes during approach, NAV mode is either automatically armed or automatically engaged.
For RNP AR, check that NAV mode engages immediately (minimum height 100 ft).

SECURING THE AIRCRAFT

Applicable to: ALL

Ident.: PRO-NOR-SOP-23-A-00011028.0001001 / 09 NOV 21

The flight crew should apply the following procedure as per company policy, when the last passenger left the aircraft and the securing of the aircraft is intended.
Airbus recommends performing the following procedure when the aircraft is left unattended: i.e. no qualified flight crew or ground crew are in the cockpit to supervise and monitor the aircraft systems.

Prior to performing this check, the following SUP Adverse Weather procedures should be taken into account when appropriate:
- Securing the aircraft for cold soak (*Refer to PRO-NOR-SUP-ADVWXR Securing the Aircraft for Cold Soak*).
- Water system draining (*Refer to PRO-NOR-SUP-ADVWXR Water System Depressurization or Draining - General*).
- Operations on contaminated airports (*Refer to PRO-NOR-SUP-ADVWXR Parking*).
- Operations with volcanic ash, sand or dust (*Refer to PRO-NOR-SUP-ADVWXR Securing the Aircraft*).

COMMUNICATIONS AND STANDARD TERMS

Ident.: PRO-NOR-SCO-00011825.0001001 / 29 JUN 11
Applicable to: ALL

Standard phraseology is essential to ensure effective crew communication. The phraseology should be concise and exact. The following Chapter lists the callouts that should be used as standard. They supplement the callouts identified in the SOP.
These standard Airbus callouts are also designed to promote situational awareness, and to ensure crew understanding of systems and their use in line operation.

CHECKLIST CALLOUTS

Ident.: PRO-NOR-SCO-00011826.0001001 / 17 AUG 10
Applicable to: ALL

- "CHECK" : A command for the other pilot to check an item.
- "CHECKED" : A response that an item has been checked.
- "CROSSCHECKED" :A callout verifying information from both pilot stations.

If a checklist needs to be interrupted, announce : “HOLD CHECKLIST AT ___” and “RESUME CHECKLIST AT ___” for the continuation.
Upon completion of a checklist announce : “__CHECKLIST COMPLETE”.

ACTIONS COMMANDED BY PF

Applicable to: ALL

Ident.: PRO-NOR-SCO-A-00011827.0001001 / 10 JAN 11

GENERAL

The following commands do not necessarily initiate a guidance mode change, e.g.: selected to managed/managed to selected. The intent is to ensure clear, consistent, standard communication between crewmembers.
All actions performed on the FCU and MCDU must be checked on the PFD and ND (e.g.: “FL 350 blue”, "FL 200 magenta”). Ensure that the correct FCU knob is used, then verify indications on the PFD/ND.

Ident.: PRO-NOR-SCO-A-00011828.0001001 / 15 JUN 15

SET

The “SET” command means using an FCU knob to set a value, but not to change a mode.

SET is accomplished by only rotating the appropriate selection knob. Example:
- ”SET GO AROUND ALTITUDE__FT”
- “SET FL __”
- “SET HDG __”

Ident.: PRO-NOR-SCO-A-00011829.0001001 / 03 DEC 13

MANAGE/PULL

The “MANAGE” command means pushing an FCU knob to engage, or arm, a managed mode or target.

The “PULL” command means pulling an FCU knob to engage a selected mode or target. Example:

- “PULL HDG 090”	(HDG/TRK knob is pulled and turned).
- “MANAGE NAV”	(HDG/TRK knob is pushed).
- “FL 190 PULL”	(ALT knob is turned and pulled).
- “FL 190 MANAGE”	(ALT knob is turned and pushed).
- “PULL SPEED 250 KNOTS”	(SPD/MACH knob is pulled and turned).
- “MANAGE SPEED”	(SPD/MACH knob is pushed).

Note: *If the value was previously set, there is no requirement to repeat the figure. Simply call e.g. PULL HDG: PULL SPEED: FL PULL.*

The VS/FPA knob has no managed function. The standard callouts for the use of this knob are as follows:
V/S Plus (or Minus) 700 PULL, or

FPA Minus 3 ° PULL	(V/S/FPA knob is turned and pulled)
PUSH TO LEVEL OFF	(V/S/FPA knob is pushed)

Ident.: PRO-NOR-SCO-A-00011830.0001001 / 10 JAN 11

ARM

The “ARM __” command means arming a system by pushing the specified FCU pb.
e.g.: “ARM APPROACH”
e.g.: “ARM LOC.”

Ident.: PRO-NOR-SCO-A-00011831.0001001 / 10 JAN 11

ON/OFF

The simple ON or OFF command is used for the autopilot, flight directors, autothrust and the bird (flight path vector).
e.g.: BIRD ON (The HDG-V/S/TRK-FPA pb is pushed).

FMA

Ident.: PRO-NOR-SCO-00011832.0001001 / 23 DEC 14
Applicable to: ALL

The PF should call out any FMA change, unless specified differently (e.g. CAT II & III task sharing). Therefore, the PF should announce :
- All armed modes with their associated color (e.g. blue, magenta): "G/S blue", "LOC blue"
- All active modes without their associated color (e.g. green, white): "NAV", "ALT".

The PM should check and respond, "CHECKED" to all FMA changes called out by the PF.

ALTITUDE

Ident.: PRO-NOR-SCO-00011833.0001001 / 23 DEC 14
Applicable to: ALL

The PM calls out "one thousand to go" when passing 1 000 ft before the cleared altitude or FL, and the PF calls out "checked".

FLAPS OR GEAR CALLOUTS

Applicable to: ALL

Ident.: PRO-NOR-SCO-B-00011834.0001001 / 23 DEC 14

FLAPS' CALLOUTS

FLAPS' CONFIGURATION	CALL
1	"FLAPS ONE"
1 + F	"FLAPS ONE"
0	"FLAPS ZERO"

The reply will be given when selecting the new flap position.
e.g:

	CALLOUT	REMARK
PF	"FLAPS ONE"	
PM	"SPEED CHECKED"	PM checks the speed: - Above the S or F speed and accelerating (Takeoff) - Below VFE next and decelerating (Approach)
	"FLAPS ONE"	PM selects the FLAPS lever position and replies after checking the blue number on the ECAM flaps indicator to confirm the correct selection has been made.

Ident.: PRO-NOR-SCO-B-00011835.0001001 / 23 DEC 14

GEAR CALLOUTS

	CALLOUT	REMARK
PF	"GEAR UP (DOWN)"	
PM	"GEAR UP (DOWN)"	The PM selects the L/G lever position and replies after checking the red lights on the LDG GEAR indicator to confirm gear operation.

FLIGHT PARAMETERS

Ident.: PRO-NOR-SCO-C-00011836.0001001 / 02 JUN 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP

APPROACH

During approach, the PM announces:
- "SPEED" if the speed decreases below the speed target -5 kt, or increases above the speed target +10 kt.
- "SINK RATE" when the descent rate exceeds 1 200 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than 0 ° or higher than +10 °
- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "VDEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 °(VOR) or 5 ° (ADF ◁)
- "__FT HIGH (LOW)" at altitude checks points.

Note: *The PM announces the attitude deviations until landing.*

Ident.: PRO-NOR-SCO-C-00011836.0004001 / 28 MAY 20
Applicable to: LV-KAN, LV-KAO

APPROACH

During approach, the PM announces:
- "SPEED" if the speed decreases below the speed target -5 kt, or increases above the speed target +10 kt
- "SINK RATE" when the descent rate exceeds 1 200 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than 0 ° or higher than +10 °

- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "VDEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 °(VOR) or 5 ° (ADF ◁)
- "__FT HIGH (LOW)" at altitude checks points.

Note: The PM announces the attitude deviations until landing.

RNAV (RNP) APPROACH

- "LAT-DEV", when L/DEV reaches ½ dot
- "VDEV", when ½ dot deviation above or below path
- "SINK RATE", when the descent rate exceeds 1 200 ft/min
- "BANK", when the bank angle goes above 30 °.

Ident.: PRO-NOR-SCO-C-00011836.0006001 / 04 NOV 20
Applicable to: LV-KHT, LV-KHU

APPROACH

The PM announces:

- "SPEED" if the speed goes below the speed target -5 kt, or goes above the speed target +10 kt
- "SINK RATE" when the descent rate goes above 1 200 ft/min
- "BANK" when the bank angle goes above 7 °
- "PITCH" when the pitch attitude goes below 0 ° or above +10 °
- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS
- "CROSS TRACK" when the XTK goes above 0.1 NM
- "VDEV" when the vertical deviation goes above ½ dot
- "COURSE" when the course goes above ½ dot or 2.5 °(VOR) or 5 ° (ADF ◁)
- "__FT HIGH (LOW)" at altitude checks points.

Note: The PM announces the attitude deviations until landing.

RNAV(RNP) APPROACH

The PM announces:

- "CROSS TRACK", when XTK error reaches 0.1 NM
- "VDEV", when ½ dot deviation goes above or below path

- "SINK RATE", when the descent rate goes above 1 200 ft/min
- "BANK", when the bank angle goes above 30 °.

Ident.: PRO-NOR-SCO-C-00021402.0001001 / 22 MAR 17
Applicable to: ALL

LANDING

During landing, the PM announces:

- "PITCH PITCH", if the pitch attitude approaches the tail strike pitch limit indicator ◁ , or reaches 7.5 °.
- "BANK BANK", if the bank angle reaches 7 °.

Ident.: PRO-NOR-SCO-C-00011837.0001001 / 22 MAR 17
Applicable to: ALL

GO-AROUND

During a go-around, the PM announces:

- "BANK", if the bank angle becomes greater than 7 °
- "PITCH", if the pitch attitude becomes greater than 20 ° up or less than 10 ° up
- "SINK RATE", if there is no climb rate.

PF/PM DUTIES TRANSFER

Ident.: PRO-NOR-SCO-00011838.0001001 / 23 DEC 14
Applicable to: ALL

To transfer control, flight crewmembers must use the following callouts:

To give control : The pilot calls out "YOU HAVE CONTROL". The other pilot accepts this transfer by calling out "I HAVE CONTROL", before assuming PF duties.

To take control: The pilot calls out "I HAVE CONTROL". The other pilot accepts this transfer by calling out "YOU HAVE CONTROL", before assuming PM duties.

SUMMARY FOR EACH PHASE

Applicable to: ALL

Ident.: PRO-NOR-SCO-D-00011841.0001001 / 23 DEC 14

	TO REMOVE GROUND SUPPLY	
EVENT	**PF or PM**	**GND Mech**
Initial ground contact	GROUND (from) COCKPIT	COCKPIT (from) GROUND
External __ disconnection	REMOVE EXTERNAL __	EXTERNAL__ REMOVED

Ident.: PRO-NOR-SCO-D-00011843.0001001 / 18 NOV 21

PUSHBACK/ENGINE START		
EVENT	**PF**	**GND Mech**
When ready for pushback, and pushback clearance received from ATC	GROUND (from) COCKPIT, CLEARED FOR PUSH	COCKPIT (from) GROUND, RELEASE BRAKES
Start of push	BRAKES RELEASED READY TO PUSH	
When ready to start engines	CLEAR TO START? STARTING ENG(S)__	CLEAR TO START
When pushback complete	BRAKES SET	SET BRAKES
When ready to disconnect (after engine started, and parameters are stabilized)	CLEAR TO DISCONNECT (hand signals on left/right)	DISCONNECTING (hand signals on left/right)

Ident.: PRO-NOR-SCO-D-00011845.0001001 / 24 NOV 23

TAXI		
EVENT	**PF**	**PM**
When taxi clearance obtained	CLEAR LEFT (RIGHT) SIDE	CLEAR RIGHT (LEFT) SIDE
Brake transfer check	BRAKE CHECK	PRESSURE ZERO
Flight control check (can be done before start of taxi):	FLIGHT CONTROL CHECK	
1. Elevators		FULL UP, FULL DOWN, NEUTRAL
2. Ailerons/Spoilers		FULL LEFT, FULL RIGHT, NEUTRAL
3. Rudder (1)	RUDDER	FULL LEFT, FULL RIGHT, NEUTRAL

(1) *The PM should follow pedal movement with PM's feet.*

Ident.: PRO-NOR-SCO-D-00011846.0001001 / 24 NOV 23

TAKE-OFF		
EVENT	**PF**	**PM**
Setting thrust levers to initial stabilization value	TAKEOFF	
Before passing 80 kt		THRUST SET
At 100 kt	CHECKED	ONE HUNDRED KNOTS

Continued on the following page

Continued from the previous page

TAKE-OFF		
EVENT	**PF**	**PM**
At V1		V1 (1)
At VR		ROTATE
Gear retraction	GEAR UP	POSITIVE CLIMB GEAR UP
If AP is engaged by PM	AP 1(2) ON	

(1) *The PM monitors the auto callout, or announces if it is inoperative.*

Ident.: PRO-NOR-SCO-D-00011848.0001001 / 18 MAY 16

ALTIMETER SETTING CHANGES TO/FROM QNH/QFE-STD		
EVENT	**PF**	**PM**
Barometric setting change and subsequent altimeter cross-check	SET STANDARD (SET QNH/QFE) CHECKED	STANDARD (QNH/QFE) CROSS-CHECKED PASSING FL __(__FT) NOW

Ident.: PRO-NOR-SCO-D-00011849.0001001 / 24 NOV 23

APPROACH AND LANDING		
EVENT	**PF**	**PM**
Activation of approach Phase	ACTIVATE APPROACH PHASE	APPROACH PHASE ACTIVATED
RA alive	CHECKED	RADIO ALTIMETER ALIVE (1)(2)
At F-G/S*, G/S*, FINAL APP or below the go-around altitude for approach with FPA guidance	● **If the PF requests the PM to set the go-around altitude:** SET GA ALTITUDE_FT	GA ALTITUDE_SET
	● **If the PF sets the go-around altitude:** GA ALTITUDE_SET	CHECKED
FDP	CHECKED	PASSING__(Fix Name),__FT,
1 000 ft RA	CHECKED	ONE THOUSAND (2)
100 ft above MDA/DH	CHECKED	ONE HUNDRED ABOVE (2)
MDA/DH visual reference(6)	CONTINUE	MINIMUM (2)

Continued on the following page

Continued from the previous page

APPROACH AND LANDING		
EVENT	**PF**	**PM**
MDA/DH no visual reference(6)	GO AROUND-FLAPS	MINIMUM (2)
100 ft RA		ONE HUNDRED (2)
50 ft RA		FIFTY (2)
After touchdown Ground spoilers extended REV green on EWD		SPOILERS (3) REVERSE GREEN, (4)
Deceleration		DECEL (5)
Autobrake disengagement	MANUAL BRAKING(7)	AUTOBRAKE OFF(8)
At 70 kt	CHECKED	SEVENTY KNOTS

(1) *Flight crew awareness, flight crew should now keep RA in scan to landing.*

(2) *PM monitors pin-programmed auto callout, or announces if inoperative.*

(3) *If the spoilers are not extended, call "NO SPOILERS".*

(4) *If the reverse deployment is not as expected, call "NO REVERSE ENGINE_" or "NO REVERSE", as appropriate.*

(5) *In the case of a failure or no deceleration, "NO DECEL"*

The "DECEL" callout means that the deceleration is felt by the flight crew and confirmed by:
- *The speed trend on the PFD, or*
- *The DECEL ◁ indication on the PFD, if the autobrake is active.*

The DECEL ◁ indication appears when the current deceleration rate reaches 80 % of the selected rate. However, the DECEL ◁ indication does not indicate that the autobrake is operating correctly, it only indicates that the selected deceleration rate is almost reached. For example, the DECEL ◁ indication may not appear on a contaminated runway because of the anti-skid effect, even if the autobrake is active.

(6) *In the case of circling approach, this callout should be performed at the latest, at the MAP.*

(7) *PF announces MANUAL BRAKING when using the brake pedals if:*
- *Autobrake was selected for the landing*
- *No AUTOBRAKE OFF callout from the PM.*

(8) *PM announces AUTOBRAKE OFF if:*
- *Autobrake does not engage as expected or autobrake disengages*
- *No MANUAL BRAKING callout from the PF.*

AIRFRAME DEICING/ANTI-ICING PROCEDURE ON GROUND

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-D-00020536.0033001 / 28 MAY 20

BEFORE FLUID SPRAYING

In all situations, it is responsibility of the captain to decide if the ground crew must deice/anti-ice the aircraft, and/or if additional deicing/anti-icing treatment are required.

CAUTION
- Make sure that the low or high-pressure ground connectors do not supply any external air to the aircraft.
- If it is necessary for the ground crew to repeatedly anti-ice the aircraft, they must deice the surfaces with a hot fluid mixture before applying a new layer of anti-icing fluid.

COMMUNICATION WITH GROUND CREW..ESTABLISH

L2 *Establish communication with the crew that will apply the procedure.*

L1 DEICING/ANTI-ICING FLUIDS TYPE...CHECK APPROPRIATE

L2 *Check that the ground crew uses the correct deicing/anti-icing fluids, in accordance with the applicable operator requirements and AMM.*

L1 DO NOT START THE ENGINES DURING FLUID SPRAYING

L2 *Engines and APU can be either stopped or running during deicing/anti-icing.*

L1

CAUTION
- The ground crew should take care when spraying deicing fluid, and make sure that the engines and APU do no ingest any fluid.
- Do not move flaps, slats, ailerons, spoilers or elevators if they are not free of ice.
- Always ensure that both left and right side of the aircraft receive the same complete and symmetrical deicing/anti-icing treatment.

Note: *In case of frost formation on one or several areas of the wing, the Captain can request a local deicing application only on the affected areas. The Captain shall take care that both wings receive the same symmetrical treatment, even if frost formation does not affect both wing symmetrically. For more information, refer to AMM.*

CABIN PRESS MODE SEL..CHECK AUTO
ENG 1 BLEED...OFF
ENG 2 BLEED...OFF

Note: *If both engines are running, the AIR ENG 1+2 BLEED FAULT alert triggers when both ENG BLEED pb-sw are set to OFF. If this occurs, disregard this alert.*

APU BLEED...OFF

DITCHING pb.. ON

L2 *Outflow valves, pack flow control valves, avionics ventilation overboard valve close.*
This prevents de-icing fluid from entering the aircraft. Avionics ventilation is provided by operating cabin fans, since air blows to the inboard valve. Considering the low OAT, there is no time limitation associated with this configuration.

L1 *Note:* 1. *The CAB PR FWD OFV NOT OPEN, CAB PR AFT OFV NOT OPEN, and COND LAV + GAL VENT FAULT alerts trigger. Disregard these alerts.*
2. *For passenger comfort reason, it is not recommended to operate on ground with both PACKS set to OFF for more than 20 min.*

THRUST LEVERS..CHECK IDLE
“AIRCRAFT PREPARED FOR SPRAYING”.. INFORM GROUND CREW

Ident.: PRO-NOR-SUP-ADVWXR-D-00002032.0003001 / 05 MAR 19

UPON COMPLETION OF THE SPRAYING OPERATION

PITOTS AND STATICS (ground crew)..CHECK

CAUTION	When the OAT is low (below -5 °C) during snow/freezing rain precipitations and with crosswind conditions, melted snow or raindrops may drip from the cockpit windshields and freeze on the fuselage below. Ice may then build up and possibly disturb the airflow around the static/pitot/angle-of-attack probes, and result in unreliable air data measurements during takeoff. Therefore during taxi out before takeoff beware of this possible build up of ice. The area around static/pitot/angle-of-attack probes must be free of ice/snow before starting takeoff.

GROUND EQUIPMENT.. REMOVE
DE-ICING/ANTI-ICING REPORT.. RECEIVED

The information from ground personnel who performed the de-icing and post-application check must include (ANTI-ICING CODE):
- *The type of fluid used*
- *The ratio of fluid to water (e.g. 75/25)*
- *The time of the holdover beginning*
- *The result of post-application check "Aircraft critical parts are clean".*

DITCHING pushbutton..OFF
OUTFLOW VALVE..CHECK OPEN

On the ECAM PRESS page, confirm that the outflow valve indication reaches the open green position to avoid any unexpected aircraft pressurization.

CAUTION	*If spraying is performed with the engines not running, a small negative cabin delta P may appear for a short time, just after selecting the ditching pushbutton to OFF. During this time, do not open any doors or windows.*

- **At least 1 minute after completion of spraying operations:**

  ENG 1 BLEED...ON
  ENG 2 BLEED...ON

- **At least 5 minutes after completion of spraying operation:**

  APU BLEED...AS RQRD

  Note: *There is a risk of de-icing fluid ingestion by the APU air intake, resulting in specific odors, or smoke warnings. Therefore:*

  - *Keep the APU running with the APU BLEED OFF for 5 min after spraying completion before setting the APU BLEED to ON (if required),*
  - *Consider APU BLEED OFF for takeoff.*

NORMAL PROCEDURE...RESUME

Apply appropriate normal procedures. Pay special attention to the flight control check. In freezing precipitation, perform the appropriate checks to evaluate aircraft icing. Base the decision on whether to takeoff, or to re-protect the aircraft, on the amount of ice that has built up on the critical surfaces since the last de-icing, as revealed by a personal inspection from the inside and outside of the aircraft. Make this inspection before the holdover time expires, or just before takeoff.

ENGINE ICE SHEDDING ON GROUND

Ident.: PRO-NOR-SUP-ADVWXR-00009179.0006001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

INTRODUCTION

During taxi in icing conditions, for temperatures below +1 °C (34 °F), ice accretion may affect the fan and core engine parts.

The following two procedures have been developed for shedding ice:
- The first is applicable for shedding ice that has built up on the fan:
  - When freezing fog is not present, or
  - When the engines are operated on ground at idle, for less than 45 min (cumulative previous flight taxi-in plus taxi-out times), in the presence of freezing fog.
- The second is applicable for shedding ice that has built up on the fan, and in the core engine:
  - When freezing fog is present, and
  - When the engines are expected to operate on ground at idle, for more than 45 min. This case is covered by below-mentioned procedures A, B, or C.

In presence of freezing fog and if no core ice shedding was applied: record a specific entry in the Logbook with the engine total ground running time (including taxi-in and taxi-out time) when it is longer than 30 min.

PROCEDURES

CAUTION	If this procedure is not applied, potential adverse engine deterioration may occur.

TAXI-IN

The logbook must be used to record the taxi-in time in freezing fog, in order to be able to determine the remaining taxi-out time, allowed for the next flight.

TURNAROUND

If it is anticipated that the maximum available taxi time of 45 min will be exceeded before the next takeoff, it is recommended to request that maintenance personnel apply Procedure “C” (see below) during the turnaround. This will allow the use of the maximum allowed taxi time (45 min) during the next taxi-out.

TAXI-OUT

The following procedures are also summarized in the flow chart below:

● **If icing conditions have been identified, without freezing fog:**

During ground operations, when in icing conditions at idle and the OAT is below +1 °C (34 °F), apply the following procedure to shed any possible ice on the fan:

CAUTION	If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.

If ground surface conditions and the environment permit, accelerate the engines to not less than 50 % of N1 for 10 s at intervals not greater than 1 h.

In addition, perform this engine acceleration also just before take-off, with particular attention to engine parameters to ensure normal engine operation.

- **If icing conditions have been identified, with freezing fog:**

  It is recommended to check with the ATC, to determine if the takeoff can be performed within the total allowed taxi time of 45 min.

  - **If the total taxi time is shorter than 45 min:**

    It is only necessary to shed fan ice. This can be achieved by applying the above-mentioned ice shedding procedure.

  - **If the total taxi time is expected to be longer than 45 min:**

    Before reaching 45 min of cumulative taxi time, apply the following procedure:

■ **Procedure A: If -7 °C (19 °F) < OAT <1 °C (34 °F) and below 45 min of cumulative taxi time**

ATC..INFORM
PARKING BRAKE (or brake with pedals)..ON

CAUTION	If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.

THRUST LEVERS..50 % N1

If ground surface condition and the environment permit, accelerate engines not less than 50 % N1 for 1 min.

Procedure “A”..Record in the LOGBOOK

■ **Procedure B: If -20 °C (-4 °F) < OAT ≤ -7 °C (19 degrees F) and below 45 min of cumulative taxi time**

ATC..INFORM
PARKING BRAKE (or brake with pedals)..ON

CAUTION	If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.

THRUST LEVERS..70 % N1

If ground surface conditions and the environment permit, accelerate the engines one after the other, each not less than 70 % N1 for 50 s.

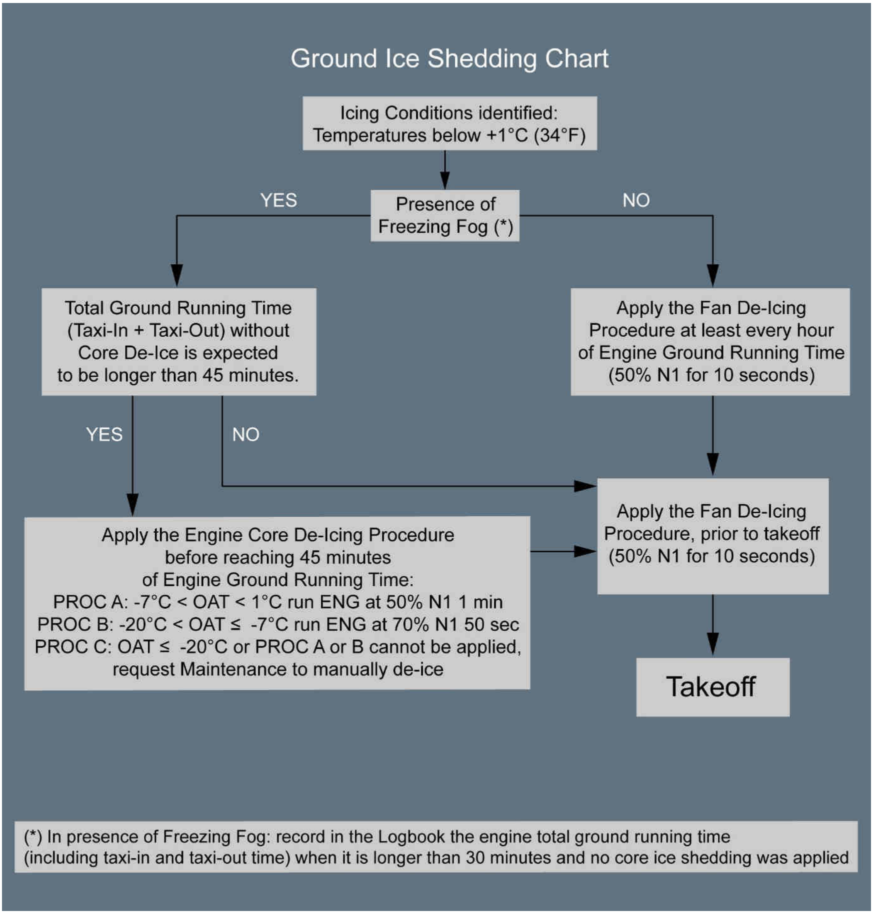
Procedure “B”..Record in the LOGBOOK

■ **Procedure C : If OAT ≤ -20 °C (-4 °F), or if procedures “A” or “B” cannot be applied (ground surface conditions or the environment do not permit the application of the procedures), or if the cumulative taxi time has exceeded 45 min:**

Request that maintenance:

- Inspect the Variable Inlet Guide Vanes (VIGV) for ice, and
- If necessary, manually de-ice the core engine.

In accordance with the "Cold Weather Maintenance - Maintenance Practice to Manually De-Ice the Core Engine" section of the Aircraft Maintenance Manual.



Ground Ice Shedding Chart
Icing Conditions identified:
Temperatures below +1°C (34°F)
Presence of Freezing Fog (*)
YES
NO
Total Ground Running Time (Taxi-In + Taxi-Out) without Core De-Ice is expected to be longer than 45 minutes.
Apply the Fan De-Icing Procedure at least every hour of Engine Ground Running Time (50% N1 for 10 seconds)
YES
NO
Apply the Engine Core De-Icing Procedure before reaching 45 minutes of Engine Ground Running Time:
PROC A: -7°C < OAT < 1°C run ENG at 50% N1 1 min
PROC B: -20°C < OAT ≤ -7°C run ENG at 70% N1 50 sec
PROC C: OAT ≤ -20°C or PROC A or B cannot be applied, request Maintenance to manually de-ice
Apply the Fan De-Icing Procedure, prior to takeoff (50% N1 for 10 seconds)
Takeoff

(*) In presence of Freezing Fog: record in the Logbook the engine total ground running time (including taxi-in and taxi-out time) when it is longer than 30 minutes and no core ice shedding was applied

ENGINE OPERATIONS ON GROUND IN ICING CONDITIONS

Ident.: PRO-NOR-SUP-ADVWXR-00025943.0002001 / 12 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

INTRODUCTION

CAUTION	During engine operations on ground in icing conditions, and with the OAT at +3 °C (37 °F) or below, ice accretion may affect the engine fan blades, spinner, or stators of the low pressure compressor. Apply the following engine ice shedding procedure to prevent possible engine degradation or damage.

The quantity of ice accretion depends on the time during which the engine is running on ground in the above-mentioned icing conditions.
This procedure involves the performance of engine accelerations before the end of specific time intervals, or if the engine vibrations increase during taxi.

PRELIMINARY COCKPIT PREPARATION

● **If the engines are operated on ground in icing conditions with the OAT at +3 °C (37 °F) or below:**

LOGBOOK...CHECK

Note: *Check the taxi-in time of the previous flight in icing conditions with the OAT at + 3 °C (37 °F) or below recorded in the logbook.*

MAXIMUM TIME TO NEXT ENGINE ACCELERATION..........................DETERMINE

- *The maximum time to next engine acceleration is the difference between 30 min and the taxi-in time of the previous flight recorded in the logbook*
- *If there is freezing rain, freezing drizzle, freezing fog, or heavy snow, the maximum time to next engine acceleration is the difference between 10 min and the taxi-in time of the previous flight recorded in the logbook*
- *Disregard the taxi-in time of the previous flight if a maintenance task to deice the engines is performed before engine start.*

SOP PRELIMINARY COCKPIT PREPARATION.................................RESUME

TAXI-OUT

TAXI TIME...MONITOR

Perform the following procedure before the taxi time reaches the maximum time to next engine acceleration, or if the engine vibrations increase.

WARNING	Before and during the application of the procedure, ensure that the jet blast due to the increased thrust does not result in any hazard to people or installations behind the aircraft.

GND SURFACE COND & AREA....................CHECK
ATC....................NOTIFY
PARKING BRAKE....................ON

CAUTION	Pay special attention to the aircraft movement during this procedure. If during thrust increase the aircraft starts to move, immediately retard the thrust levers to IDLE.

CAUTION	If the ground surface conditions or the area behind the aircraft do not permit to accelerate up to 60 % N1, then the thrust setting and the hold time should be as high as possible.

■ **If in icing conditions with the OAT at +3 °C (37 °F) or below:**

THR LEVERS....................60 % N1 for 30 s
THR LEVERS....................RETARD TO IDLE

Repeat this procedure at intervals not longer than 30 min, or if the engine vibrations increase.

■ **If in icing conditions with the OAT at + 3 °C (37 °F) or below and if there is freezing rain, freezing drizzle, freezing fog, or heavy snow:**

THR LEVERS....................60 % N1 (NO HOLD TIME)
THR LEVERS....................RETARD TO IDLE

Repeat this procedure at intervals not longer than 10 min, or if the engine vibrations increase.

SOP TAXI....................RESUME

BEFORE TAKEOFF

LINE UP CLEARANCE

A final engine acceleration must be performed before takeoff to entirely clean the engine from ice accretion.

ATC....................NOTIFY

L2 *Inform ATC that an engine procedure will be performed after line up.*

L1 **DO NOT PERFORM ROLLING TAKEOFF**

L2 *The following procedure must be performed after alignment, with the aircraft stopped.*

L1 SOP BEFORE TAKEOFF....................RESUME

TAKEOFF

AFTER LINE UP

PARKING BRAKE (OR BRAKE WITH PEDALS)....................APPLY

L2 *Apply braking with the pedals or the parking brake, as required.*

L1

CAUTION	Pay special attention to the aircraft movement during this procedure. If during thrust increase the aircraft starts to move, immediately retard the thrust levers to IDLE.

- ■ **If in icing conditions with the OAT at +3 °C (37 °F) or below:**
  THR LEVERS....................60 % N1 for 30 s
  THR LEVERS....................RETARD TO IDLE
- ■ **If in icing conditions with the OAT at + 3 °C (37 °F) or below and if there is freezing rain, freezing drizzle, freezing fog, or heavy snow:**
  THR LEVERS....................60 % N1 (NO HOLD TIME)
  THR LEVERS....................RETARD TO IDLE

SOP TAKEOFF....................RESUME

AFTER LANDING

TAXI-IN TIME....................MONITOR

Perform the following procedure when in icing conditions with the OAT at + 3 °C (37 °F) or below:

- If the engine vibrations increase, or
- At the latest when the taxi-in time reaches:
  - 30 min, or
  - 10 min, if there is freezing rain, freezing drizzle, freezing fog, or heavy snow.

WARNING	Before and during the application of the procedure, ensure that the jet blast due to the increased thrust does not result in any hazard to people or installations behind the aircraft.

GND SURFACE COND & AREA....................CHECK
ATC....................NOTIFY
PARKING BRAKE....................ON

CAUTION	Pay special attention to the aircraft movement during this procedure. If during thrust increase the aircraft starts to move, immediately retard the thrust levers to IDLE.

CAUTION	If the ground surface conditions or the area behind the aircraft do not permit to accelerate up to 60 % N1, then the thrust setting and the hold time should be as high as possible.

- **If in icing conditions with the OAT at +3 °C (37 °F) or below:**

  THR LEVERS....60 % N1 for 30 s
  THR LEVERS....RETARD TO IDLE

  Repeat this procedure at intervals not longer than 30 min, or if the engine vibrations increase.

- **If in icing conditions with the OAT at + 3 °C (37 °F) or below and if there is freezing rain, freezing drizzle, freezing fog, or heavy snow:**

  THR LEVERS....60 % N1 (NO HOLD TIME)
  THR LEVERS....RETARD TO IDLE

  Repeat this procedure at intervals not longer than 10 min, or if the engine vibrations increase.

SOP AFTER LANDING....RESUME

PARKING

TAXI-IN TIME....RECORD IN THE LOGBOOK

L2 *Record the taxi-in time in icing conditions with OAT at +3 °C (37 °F) or below, or the taxi-in time after last engine acceleration if performed. This time is used to determine the maximum time to next engine acceleration for the next flight.*

L1 SOP PARKING....RESUME

GROUND OPERATIONS IN COLD WEATHER CONDITIONS

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-A-00020553.0001001 / 17 NOV 20

GENERAL

For ground operations on contaminated runways, *Refer to EFB-TOF-30-30 Descriptions* and *Refer to PRO-NOR-SUP-ADVWXR General*.
The following procedures supplement the normal operating procedures.

L2 *Note: At low outside air temperatures, avoid keeping the doors unnecessarily open, since this causes temperature regulation problems in the cockpit and in cabin areas near the doors.*

Ident.: PRO-NOR-SUP-ADVWXR-A-00020555.0001001 / 20 MAR 17

SAFETY EXTERIOR INSPECTION

PROTECTIVE COVERS....REMOVED
APU INTAKE....CHECK FREE OF SNOW AND ICE

PACKS INLET/OUTLET DOORS....................CHECK FREE OF SNOW AND ICE
OUTFLOW VALVES....................CHECK FREE OF SNOW AND ICE
PRESSURE RELIEF VALVES....................CHECK FREE OF SNOW AND ICE

PRELIMINARY COCKPIT PREPARATION

PRELIMINARY COCKPIT PREPARATION - SOP....................COMPLETED

L2 APU is started and the air conditioning is on.

Note: *1. Ground power should be used to start the APU if the OAT is -15 °C (5 °F) or below.*
2. With cockpit temperatures below -15 °C (5 °F), the display units may not be available.

L1 ● **If the avionics bay is cold soaked:**

L2 The aircraft was parked without electrical ground supply or without air conditioning.

L1 IRS....................INITIATE ALIGNMENT

L2 For temperatures at or below -15 °C (5 °F) in the avionics bay, the IRS alignment requires 15 min.

L1 WINDSHIELD AND UPPER COCKPIT FUSELAGE....................ICE/SNOW REMOVED

CAUTION	With ice or snow accumulated on the windshield and/or the upper cockpit fuselage, and if the PROBE/WINDOW HEAT is on, melted ice or snow running down from these areas could re-freeze on the fuselage area below, if the temperature is very low. This could create ice build-up on the forward fuselage that could possibly disturb the airflow around the static/pitot/angle-of-attack probes.

PROBE COVERS....................CHECK REMOVED

L2 Ensure that the probe covers are removed in order to prevent them from melting.

L1 PROBE/WINDOW HEAT....................ON

Ident.: PRO-NOR-SUP-ADVWXR-A-00020601.0001001 / 05 JUN 18

EXTERIOR WALKAROUND

SURFACES....................CHECK FREE OF FROST, ICE AND SNOW

L2 *Check critical surfaces: leading edges, upper wing surfaces, vertical and horizontal stabilizers, all control surfaces, slats and flaps.*

Note: *Thin hoarfrost is acceptable on the upper surface of the fuselage. Refer to LIM-ICE_RAIN Definition of Thin Hoarfrost.*

On the underside of the wing tank areas, a maximum layer of 3 mm (1/8 in.) of frost is acceptable.

L1 LANDING GEAR........................CHECK FREE OF FROST, ICE AND SNOW

L2 *Check gear assemblies, lever locks, tires and doors*

L1 ENGINES........................CHECK FREE OF FROST, ICE AND SNOW

L2 *Check inlets, inlet lips, fans, spinners, fan exhaust ducts, reversers assemblies.*

L1 ENGINE FANS........................CHECK FREE ROTATION

L2 *Check that engine fans are not stuck and can rotate freely.*

L1 DRAINS, BLEEDS, PROBES........................CHECK FREE OF FROST, ICE AND SNOW

L2 *Probes: pitot tubes, static ports, TAT sensors and AOA sensors.*

L1 FUEL TANK VENTS........................CHECK FREE OF FROST, ICE AND SNOW
RADOME........................CHECK FREE OF FROST, ICE AND SNOW
Lower part of the NOSE FUSELAGE........................CHECK FREE OF FROST, ICE AND SNOW
WATER SUPPLIES........................CHECK NOT FROZEN AND REFILLED

L2 *Commercial water supplies should have been previously emptied prior to aircraft cold soak.*

Ident.: PRO-NOR-SUP-ADVWXR-A-00020556.0001001 / 20 MAR 17

AFTER START

- **After first engine start:**
  PROBE/WINDOW HEAT........................AUTO

L2 Heating will continue to operate automatically.

L1 NORMAL PROCEDURE........................RESUME

MINIMUM SPEED WITH ICE ACCRETION

Ident.: PRO-NOR-SUP-ADVWXR-00020558.0002001 / 20 MAR 17
Applicable to: ALL

Evidence of ice accretion can be ice on the visual indicator (between the two cockpit windshields) or on the windshield wipers.

CAUTION	Extended flight in icing conditions with the slats extended should be avoided.

- **If wing anti-ice is operative:**
  - **In CONF clean:**

    MIN SPEED: VLS + 15 kt

- ■ **In CONF 1, 2, 3 or FULL:**

  MIN SPEED: VLS + 5 kt

The minimum speed takes into account ice accretion on non-heated structure.

- ● **If wing anti-ice is not operative:**

  MIN SPEED: VLS + 10 kt/GREEN DOT

The minimum speed takes into account ice accretion on the entire airframe when anti-ice is inoperative.

OPERATIONS ON CONTAMINATED AIRPORTS

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-B-00020561.0001001 / 20 MAR 17

GENERAL

If the ground surfaces are not contaminated but the weather corresponds to icing conditions with falling rain, slush or snow, anticipate a probable resulting runway/surfaces contamination.
There is a low probability of fluid ingestion by the engine which should anyway not degrade the safety. The risk of ingestion is independent of the depth of the contaminant.

Ident.: PRO-NOR-SUP-ADVWXR-B-00020562.0001001 / 04 MAY 23

UNDUE ALERTS

On the ground with contaminated surfaces or deicing fluid on radio altimeter antennas, the radio altimeters may indicate some erroneous values or no values.
If the PFD displays erroneous radio altimeter values, the flight crew can disregard the triggered auto callouts and/or the GPWS/EGPWS alerts.

Note: *Undue GPWS/EGPWS alerts may trigger at the apron, during taxi, takeoff and landing runs.*

If the PFD does not display any radio altimeter values on both sides, the flight crew can disregard the NAV RA 1(2) FAULT or NAV RA 1+2 FAULTalerts.

The PFD recovers the radio altimeter indication in the following cases:
- The aircraft is on a non-contaminated surface, or
- The radio altimeter antennas are no longer covered by any fluids (de-icing fluid or water).

The flight crew must check that the radio altimeter values are indicated on the PFD before entering the runway.

Ident.: PRO-NOR-SUP-ADVWXR-B-00020563.0001001 / 20 MAR 17

PARKING

- **After engine shutdown and before shutting down electrical supply:**

  FLAPS/SLATS.......................................CONFIRM FREE OF CONTAMINATION

  L2 Perform a visual inspection to determine if the flaps/slats mechanism is free of contamination. If necessary, perform decontamination.

  L1 YELLOW ELEC PUMP pb.......................................AUTO
  GREEN ELEC PUMP pb.......................................AUTO
  YELLOW ELEC PUMP pb (guarded).......................................ON
  GREEN ELEC PUMP pb (guarded).......................................ON
  SLATS/FLAPS.......................................RETRACT

  L2 *Monitor slats/flaps retraction on ECAM upper display.*

  L1
  - **When slats and flaps are retracted:**

    YELLOW ELEC PUMP pb (guarded).......................................AUTO
    GREEN ELEC PUMP pb (guarded).......................................AUTO

  NORMAL PROCEDURE.......................................RESUME

OPERATIONS WITH VOLCANIC ASH, SAND OR DUST

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-C-00020564.0001001 / 20 MAR 17

PRELIMINARY COCKPIT PREPARATION

APU.......................................AVOID USE

L2 *Request ground power for air conditioning and electricity. If ground power is not available, the APU should be used only to start the engines.*

L1 WINDSHIELD WIPERS.......................................DO NOT USE

L2 *Do not use the windshield wipers to remove ash, sand or dust.*

L1
- **For takeoff performance:**

  BRAKING PERFORMANCE MAY BE DEGRADED

  L2 *A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency.*

Ident.: PRO-NOR-SUP-ADVWXR-C-00020565.0001001 / 20 MAR 17

EXTERIOR WALKAROUND

SURFACES AND EQUIPMENT..CHECK FREE OF DEPOSITS

L2 *Ground maintenance should remove ash, sand or dust that has settled on exposed lubricated surfaces and could penetrate seals or enter the engine gas path, air conditioning system, air data probes, access doors and panels and other orifices on the aircraft.*

L1 ENGINE/APU INLETS.. CHECK FREE OF DEPOSITS

L2 *Inspect the inlets and order them cleaned of deposit. Have the area within 8 m (25 ft) of the engine inlet cleaned of volcanic ash, as much as practical.*

Ident.: PRO-NOR-SUP-ADVWXR-C-00020566.0001001 / 10 NOV 20

ENGINE START

ALL ENGINES..CRANK

L2 *Before engine start, ventilate all engines for 2 min by dry-cranking at the maximum motoring speed to remove any deposit from the booster area. Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking).*

L1
- **If air start unit is available:**
  ENGINE START WITH AN AIR START UNIT...
  Refer to PRO-NOR-SUP-ENG Engine Start with an Air Start Unit
- **If air start unit is not available:**
  SOP - ENGINE START...PERFORM

Ident.: PRO-NOR-SUP-ADVWXR-C-00020567.0003001 / 28 MAY 20

TAXI

ONE ENGINE TAXI...DO NOT PERFORM

L2 *Minimize the thrust during taxi.*

L1 ENG 1 BLEED...OFF
ENG 2 BLEED...OFF

L2 *Keep engine bleed valves closed for taxiing, especially in volcanic ash.*

L1 *Note: The AIR ENG 1+2 BLEED FAULT alert triggers when both ENG BLEED pb-sw are set to OFF. When this occurs, disregard this alert.*

FOR 180 ° TURN ON RUNWAY: INITIATE THE TURN DOWNWIND

L2 *In order to prevent ash, sand or dust ingestion.*

Ident.: PRO-NOR-SUP-ADVWXR-C-00020568.0001001 / 20 MAR 17

TAKEOFF

ASH, SAND OR DUST.. ALLOW TO SETTLE

L2 *Allow ash, sand or dust (If present) to settle on runway before starting the takeoff roll.*

L1 PACK OFF TAKEOFF.. CONSIDER

L2 *This will prevent air conditioning system contamination.*

L1 ROLLING TAKEOFF...CONSIDER

Ident.: PRO-NOR-SUP-ADVWXR-C-00020569.0001001 / 20 MAR 17

AFTER TAKEOFF

MINIMIZE TIME IN SAND OR DUST CLOUD

L2 *Climb to quickly exit the sand/dust cloud. If possible, altitude constraints may be disregarded in coordination with ATC.*

L1 ALL ENG BLEED... ON

Ident.: PRO-NOR-SUP-ADVWXR-C-00020570.0001001 / 20 MAR 17

IN FLIGHT

AVOID ASH, SAND OR DUST CLOUD

- **If sand or dust cloud encounter:**

  MINIMIZE TIME IN SAND OR DUST CLOUD

  L2 *If possible and in coordination with ATC, adapt flight path (route and altitude) to exit the cloud.*

L1
- **If ash cloud encounter:**

  VOLCANIC ASH ENCOUNTER PROCEDURE.. APPLY

Ident.: PRO-NOR-SUP-ADVWXR-C-00020571.0001001 / 20 MAR 17

DESCENT PREPARATION

SOP – DESCENT PREPARATION.. PERFORM

AUTOLAND RECOMMENDED

L2 *Deposits on the windshield may significantly reduce visibility during approach and landing. Consider a diversion to an airport where autoland is possible.*

L1
- **For landing performance:**

  CONSIDER IDLE REVERSE

  BRAKING PERFORMANCE MAY BE DEGRADED

  L2 *A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency.*

Ident.: PRO-NOR-SUP-ADVWXR-C-00020572.0001001 / 20 MAR 17

DESCENT

AVOID LEVEL FLIGHT IN ASH, SAND OR DUST CLOUD

L2 *If possible and in coordination with ATC, perform holding patterns and last level off before final descent outside of the cloud.*

Ident.: PRO-NOR-SUP-ADVWXR-C-00020573.0005001 / 28 MAY 20

LANDING

- **Before landing:**

ENG 1 BLEED.. OFF
ENG 2 BLEED.. OFF

Note: The AIR ENG 1+2 BLEED FAULT alert triggers when both ENG BLEED pb-sw are set to OFF. When this occurs, disregard this alert.

PACKS 1 and 2..AS RQRD

L2 *Consider to set the packs OFF in order to avoid contamination of the air conditioning system.*

L1
- **During landing:**

REVERSERS..AS RQRD

L2 *If it appears that maximum reverse thrust is needed, apply reverse thrust when the main landing gear touches down. Limit the use of reverse thrust as much as possible, because reverse flow may throw up ash, sand or dust and impair visibility.*

Ident.: PRO-NOR-SUP-ADVWXR-C-00020574.0001001 / 20 MAR 17

AFTER LANDING

ONE ENGINE TAXI..DO NOT PERFORM

L2 *Minimize thrust during taxi.*

L1 APU.. AVOID USE

FOR 180 ° TURN ON RUNWAY: INITIATE THE TURN DOWNWIND

Ident.: PRO-NOR-SUP-ADVWXR-C-00020575.0001001 / 20 MAR 17

SECURING THE AIRCRAFT

If the aircraft is parked at an airport contaminated with volcanic ash, sand or dust, install engine inlet covers and other protective covers and plugs.
In addition:

- **After switching off all bleeds and before switching OFF AC power:**

  DITCHING pb....................ON

L2 *This closes the outflow valve, pack valves and avionic ventilation inlet and extract valves.*

L1
- **After switching OFF the batteries:**

  DITCHING pb....................OFF

L2 *All the applicable valves will open at the next power-up.*

L1 PROTECTIVE COVERS....................INSTALL

L2 *Install protective covers/plugs to protect the aircraft/engines from volcanic ash, sand or dust.*

L1 LOGBOOK.................... REPORT ASH, SAND OR DUST CLOUD ENCOUNTER

SECURING THE AIRCRAFT FOR COLD SOAK

Ident.: PRO-NOR-SUP-ADVWXR-00020599.0001001 / 28 MAY 20
Applicable to: ALL

Cold soak should be considered in the following conditions:
- The OAT is less than 0 °C (32 °F), and
- No electrical supply and no air conditioning are provided to the aircraft, and
- The temperatures of aircraft components decrease below 0 °C (32 °F).

WHEN SECURING THE AIRCRAFT

Note: *At the beginning of a cold soak, due to a transient temperature difference between fluid in the reservoir and the system piping, the HYD G RSVR UNDERFILLED alert may be triggered in the ECAM. Check that the reservoir quantity is in the upper half part of the normal filling range. The alert may disappear with the operation of the green electrical pump.*

- **After switching off all bleeds and before switching off the electrical AC power:**

  DITCHING pb .... ON

L2 *This closes the outflow valve, pack valves and avionic ventilation inlet and extract valves.*

L1
- **When the chocks are in place:**

  PARKING BRAKE....................OFF

L2 *Releasing the parking brake prevents the brakes from freezing.*

L1
- **After switching off the electrical AC power and the batteries:**

  DITCHING pb ....OFF

L2 *All the applicable valves will open at the next power-up.*

L1 CAPT SEAT..MOST FORWARD POSITION

L2 *To ease access to the avionics bay, since seat operation becomes difficult once the mechanism is cold-soaked.*

L1 PROTECTIVE COVERS..INSTALL

L2 *Request ground crew to install protective covers and plugs, in order to protect the aircraft's wheels, engines and probes from snow and ice.*

L1 WATER SYSTEM DRAINING...REQUEST

L2 *Request maintenance actions to drain the water system for cold soak prevention purposes.*
Refer to PRO-NOR-SUP-ADVWXR Water System Depressurization or Draining - General.

L1 ● **If no ground supply or air conditioning is available:**
APU BATTERY...REMOVE

L2 *If the APU battery is subject to a cold soak for 12 h or more and the ambient temperature is below -15 °C (5 °F), its remaining capacity may not allow the cold-soaked APU to start. Remove the battery and store it in a warm place.*

WATER SYSTEM DEPRESSURIZATION OR DRAINING

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-Z-00002036.0001001 / 21 MAR 17

GENERAL

Drain the water system, if the OAT requires it, as shown below :

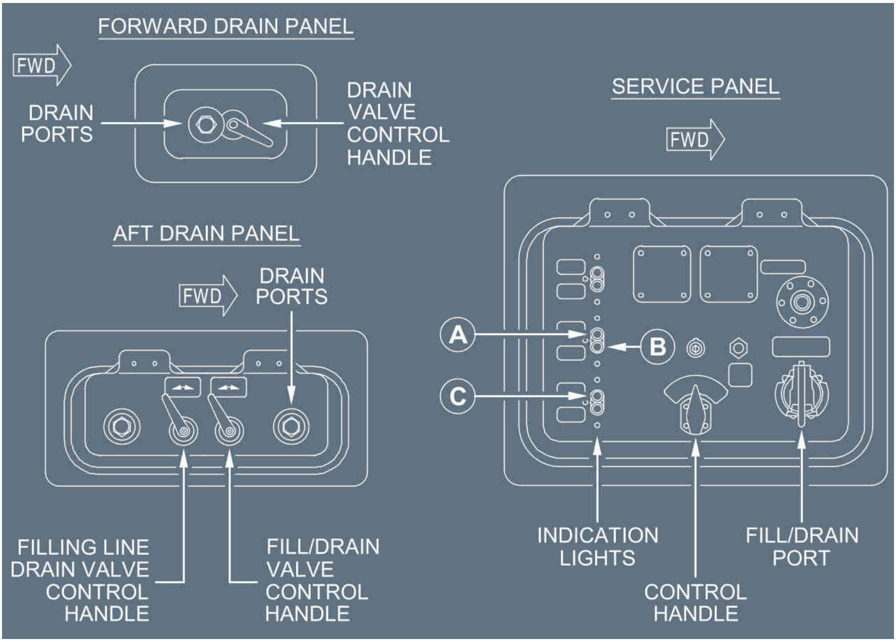
Configuration			Exposure time	Water tank drain
Air Conditioning	**Cabin temperature**	**Outside Air Temperature**		
ON	Above 10 °C (50 °F)	Between 0 and -15 °C (32 and 5 °F)	Any	Not required
		Below -15 °C (5 °F)	1 h 15 min	Required
OFF		Between 0 and -7 °C (32 and 19.4 °F)	1 h 30 min	
		Between -7 and -15 °C (19.4 and 5 °F)	0 h 30 min	
		Below -15 °C (5 °F)	Any	

Ident.: PRO-NOR-SUP-ADVWXR-Z-00002037.0002001 / 21 MAR 17

WATER DRAINING PROCEDURE

The following procedure must be applied, when the water system needs to be drained, and when the aircraft is exposed to temperatures below the freezing point.
Draining is usually carried out with the electrical power supply on.

POTABLE-WATER PANELS



FORWARD DRAIN PANEL
FWD
DRAIN PORTS
DRAIN VALVE CONTROL HANDLE
SERVICE PANEL
FWD
AFT DRAIN PANEL
FWD
DRAIN PORTS
A
B
C
FILLING LINE DRAIN VALVE CONTROL HANDLE
FILL/DRAIN VALVE CONTROL HANDLE
INDICATION LIGHTS
CONTROL HANDLE
FILL/DRAIN PORT

ACCESS PLATFORM(S)....PUT IN POSITION
SHUT-OFF VALVES IN GALLEYS/TOILETS....CHECK OPEN
WATER FAUCETS IN GALLEYS/TOILETS....CHECK MIDDLE (WARM) POSITION
FWD AND AFT DRAIN, SERVICE PANELS' ACCESS DOORS....OPEN
DRAIN PORT CAPS....REMOVE

Remove the drain port cap of the potable water service panel.

DRAIN HOSES....CONNECT

Connect drain hoses to the drain port on the :

- *Forward and aft drain panels*
- *Potable water service panel*

CONTROL HANDLE (SERVICE PANEL)....TURN TO “DRAIN” AND PULL

To drain, turn the handle to the “DRAIN” position, and then pull it out until it reaches its mechanical stop. The (A), (B), (C) indicator lights come on. Water flows out of the drain ports of the forward and aft drain, and the potable water service panels.

- **If the aircraft's electrical network is de-energized :**
  DRAIN CONTROL HANDLES (FWD and AFT DRAIN PANELS).................. TURN TO "OPEN"
  The most aft (filling line drain valve control) handle on the aft drain panel is set to the "OPEN" position. It is no longer possible to close the aft and forward drain panel access doors.

- **When the system is drained :**
  CONTROL HANDLE (SERVICE PANEL).............................PUSH AND TURN TO "NORMAL"
  The (A), (B), (C) indicator lights go off.
  - **If the aircraft's electrical network is de-energized :**
    DRAIN CONTROL HANDLES (FWD and AFT DRAIN PANELS).. ....TURN TO "SHUT"

Note: *In freezing temperatures, all drain valves must remain open after draining to prevent damage to the system.*

DRAIN HOSES...DISCONNECT
PANELS...CLEAN AND DRY

Note: *In freezing conditions, when the drain valves must stay open, do not put the caps on the service panel drain port..*

ACCESS DOORS (FWD, AFT)..CLOSE
Water drainage is assured even with access doors closed.

Note: *When the drain valve is open manually it is not possible to close the potable water service panel access door.*

ACCESS PLATFORM(S)...REMOVE

Intentionally left blank

MANUAL ENGINE START

Ident.: PRO-NOR-SUP-ENG-A-00004969.0001001 / 21 MAR 17
Applicable to: ALL

GENERAL

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases :
- **After aborting a start, because of** :
  - Engine stall
  - Engine EGT overlimit
  - Low start air pressure
- **When expecting a start abort, because of** :
  - Degraded bleed performance, due to hot conditions, or at a high-altitude airfields.
  - An engine with a reduced EGT margin in hot conditions, or at a high-altitude airfields.
  - Marginal performance of the external pneumatic power group.

Ident.: PRO-NOR-SUP-ENG-A-00020888.0006001 / 19 DEC 17
Applicable to: LV-KHT, LV-KHU

MANUAL ENGINE START PROCEDURE

Note: *A residual EGT in excess of 100 °C may result in an EGT limit exceedance during manual start. The engine should be motored to reduce residual EGT below 100 °C.*

Note: *During a manual engine start, if the flight crew suspects an engine start malfunction, or if an engine-related ECAM alert is triggered, the PF must abort the start sequence as follows:*
- *Before the ENG MASTER lever is set to ON, the PF must set the ENG MAN START pb-sw to OFF*
- *After the ENG MASTER lever is set to ON, the PF must set the ENG MAN START pb-sw to OFF, and then the ENG MASTER lever to OFF.*
  In that case, the flight crew should consider a dry crank cycle of the affected engine before they perform another start attempt (Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)).

Then, in the case of an ECAM alert, the PF must announce "ECAM actions", in accordance with the ECAM management philosophy.

THR LEVERS...IDLE

CAUTION	The engines start regardless of the thrust lever position. If the thrust levers are not set to IDLE, the thrust rapidly increases to the corresponding thrust lever position, causing a hazardous situation.

ENG START sel...NORM THEN IGN/START

The lower ECAM displays the engine page.

Note: *If both engines are started manually, the following procedure applies one engine at a time.*

- **When all engines parameters are available on the upper ECAM display (no amber crosses displayed):**
  ENG MAN START pb-sw...ON
  START VALVE...CHECK IN-LINE
  N3 INCREASE...CHECK
  OIL PRESS INCREASE...CHECK
- **When N3 reaches the maximum motoring speed (25 % minimum):**

  Note: *The maximum motoring speed is reached when there is no significant N3 increase.*

  ENG MASTER...ON
  CHRONO...START
  L2 *The PM starts the timing in order to monitor the light-up duration.*
  L1 IGNITERS A AND B...CHECK ON
  FUEL FLOW INCREASE...CHECK
- **30 s maximum after fuel flow increase:**
  EGT INCREASE...CHECK
  N1 INCREASE...CHECK
- **When N3 at or above 50 %:**
  START VALVE...CHECK CROSS LINE
  IGNITERS A AND B...CHECK OFF
- **When idle is reached (AVAIL indication is displayed):**
  MAIN ENG PARAMETERS...CHECK NORMAL
  SECONDARY ENG PARAMETERS...CHECK NORMAL
  ENG MAN START pb-sw...OFF
  ENG START sel...NORM
  SOP - ENGINE START...RESUME

- **20 s maximum after fuel flow increase:**

EGT INCREASE..CHECK
N1 INCREASE..CHECK

- **When N2 reaches 50 %:**

START VALVE (is fully closed after 3 to 4 s)..................CHECK CROSS LINE
IGNITERS A AND B (at or above 54 % N2)..................CHECK OFF
MAIN ENG PARAMETERS..................CHECK NORMAL
SECONDARY ENG PARAMETERS..................CHECK NORMAL

- **When idle is reached (AVAIL indication is displayed):**

ENG MAN START pb-sw..OFF
ENG START sel..NORM
SOP - ENGINE START..RESUME

ENGINE START WITH AN AIR START UNIT

Ident.: PRO-NOR-SUP-ENG-00020889.0001001 / 04 NOV 20
Applicable to: ALL

- **Before connecting the air start unit:**

PACK 1..OFF
PACK 2..OFF

L2 *Packs are selected off to prevent any possible contamination of the packs by the air start unit.*

L1 APU BLEED..OFF
ENG 1 BLEED..OFF
ENG 2 BLEED..OFF
X BLEED..OPEN

AIR START UNIT CONNECTION..REQUEST

L2 *Two ground air start units may be used in parallel, if the pressure/flow relation is expected to be marginal.*

L1
- **When cleared to start:**

Note: The AIR ABNORM BLEED CONFIG alert is triggered after the first engine start. It can be disregarded.

ENG 1..START

Note: - *For any operational reason, engine 2 can be started first.*
In this case, check the brake ACCU pressure prior to engine start.
- *The minimum recommended starter air supply pressure is 25 PSI when the start valve is open.*

- **After engine 1 is started:**
  - **If the air start unit is used to start engine 2:**

    ENG 2.. START
    - **When engine 2 is started:**

      AIR START UNIT DISCONNECTION.............................. REQUEST
      X BLEED.. AUTO
      ENG 1 BLEED... ON
      ENG 2 BLEED... ON
      PACK 1.. ON
      PACK 2.. ON
  - **If the crossbleed engine start procedure is used to start engine 2:**

    AIR START UNIT DISCONNECTION................................ REQUEST
    ENG 1 BLEED... ON
    PACK 1.. ON
    PACK 2.. ON
    CROSSBLEED ENGINE START PROC.................................. APPLY
    Refer to PRO-NOR-SUP-ENG Crossbleed Engine Start.

WARNING	Disconnection of the external power with the EXT PWR pb-sw set to ON may cause injury to the ground engineer. Request disconnection of the external power only with the EXT PWR pb-sw set to AVAIL.

EXT PWR... CHECK AVAIL
EXT PWR DISCONNECTION.. REQUEST

Note: *The external electrical power can be removed after the first engine start. However, be aware that electrical transients may occur in this case. Refer to PRO-NOR-SUP-ENG Engine Start with External Electrical Power.*

SOP - AFTER START... RESUME

CROSSBLEED ENGINE START

Ident.: PRO-NOR-SUP-ENG-00020890.0001001 / 17 MAR 17
Applicable to: ALL

CAUTION	Do not perform the crossbleed engine start procedure during pushback. Simultaneous use of engine bleed supply and external pneumatic power supply is prohibited.

One engine must be running in order to supply air for other engine start.

- **Before second engine start :**

APU BLEED...OFF

L2 *The BLEED valve of the supplying engine reopens and the cross bleed valve closes.*

L1 ENG BLEED (supplying engine)..............................ON
ENG BLEED (receiving engines)..............................OFF

L2 *The bleed valves of receiving engines are closed to avoid reverse flow leakage.*

L1 X BLEED...OPEN

- **When cleared to start :**

AREA CLEAR OF OBSTACLES..............................CONFIRM

L2 Ensure increased power jet wake does not constitute any hazard to people or installations behind the aircraft.

L1 THR LEVER (supplying engine)..................ADJUST FOR BLEED PRESSURE

Adjust thrust of supplying engine to obtain an engine bleed pressure of 30 PSI.
If the thrust required to obtain the appropriate engine bleed pressure exceeds 40 % N1, pay particular attention to the surrounding area.

RECEIVING ENGINE.......................................START

Apply the normal engine start procedure.

- **After start :**

THR LEVER (supplying engine)..............................IDLE
X BLEED...AUTO
ENG BLEED (receiving engine)..............................ON
PACK 1...ON
PACK 2...ON

ENGINE START WITH EXTERNAL ELECTRICAL POWER

Ident.: PRO-NOR-SUP-ENG-00020891.0001001 / 12 JUL 18
Applicable to: ALL

In order to ensure that the entire network remains electrically supplied, it is recommended to start both engines before the disconnection of the external electrical power.

EXT PWR..CHECK AVAIL

WARNING	Disconnection of the external power with the EXT PWR pb-sw ON may cause injury to the ground engineer. Request disconnection of the external power only with the EXT PWR pb-sw AVAIL.

EXT PWR DISCONNECTION..REQUEST

- **When the external power supply is disconnected:**
  - **If only one engine is running:**

    A power transient occurs when the external electrical power is disconnected, as the No Break Power Transfer (NBPT) function is not available.
  - **If both engines are running:**

    No power transient occurs, as the NBPT is available.

ENGINE START ON BATTERIES

Ident.: PRO-NOR-SUP-ENG-00020892.0004001 / 19 MAY 21
Applicable to: LV-KHT, LV-KHU

This procedure can be applied when the aircraft electrical network is only supplied by the batteries (no APU generator or external electrical power unit available).

AIR START UNIT CONNECTION..REQUEST

L2 *Two ground air start units may be used in parallel, if the pressure/flow relation is expected to be marginal.*

L1 ENG 1..PERFORM MANUAL START

Refer to PRO-NOR-SUP-ENG Manual Engine Start - Procedure.

The secondary engine parameters are not available as long as electrical power is provided by the batteries.

Engine 1 must be started first as:
- The X BLEED valve does not open automatically on batteries
- The parking brake is pressurized by engine 1.

After engine start, the EEC remains in degraded N1 mode for 4 min and the engine must not exceed idle power during this time period. Follow the ECAM procedure to recover the normal EPR mode.

- **When all parameters are stable:**
  ELECTRICAL NETWORK NORMAL OPERATION.....CHECK
  ENG 2.....PERFORM AUTOMATIC START

ENGINE START ON BATTERIES

Ident.: PRO-NOR-SUP-ENG-00020892.0002001 / 19 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

This procedure can be applied when the aircraft electrical network is only supplied by the batteries (no APU generator or external electrical power unit available).

AIR START UNIT CONNECTION.....REQUEST

L2 *Two ground air start units may be used in parallel, if the pressure/flow relation is expected to be marginal.*

L1 ENG 1.....PERFORM AUTOMATIC START

The secondary engine parameters are not available as long as electrical power is provided by the batteries.

Engine 1 must be started first as:
- The X BLEED valve does not open automatically on batteries
- The parking brake is pressurized by engine 1.

- **When all parameters are stable:**
  ELECTRICAL NETWORK NORMAL OPERATION.....CHECK
  ENG 2.....PERFORM AUTOMATIC START

ENGINE START VALVE MANUAL OPERATION

Ident.: PRO-NOR-SUP-ENG-00020893.0003001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

BEFORE ENGINE START

Advise ground crew to prepare for manual engine start valve operation.

WARNING	To ensure safety of the ground crew when starting an engine with manual operation of the start valve, the flight crew should start the affected engine first.

ENGINE START

AUDIO CONTROL PANEL.....CAB
GROUND CREW CLEARANCE.....OBTAIN

- **When the ground crew is ready:**
  “ENGINE 1(2) START”........ ANNOUNCE
  ENG START sel........ IGN/START
  ENG MASTER........ ON
  “OPEN START VALVE AND KEEP OPEN”........ ORDER
  If not maintained in the OPEN position by the ground crew, the start valve closes.
- **When N3 at 50 %:**
  “CLOSE START VALVE”........ ORDER
  SOP – ENGINE START........ RESUME

ENGINE START VALVE MANUAL OPERATION

ENGINE VENTILATION (DRY CRANKING)

Ident.: PRO-NOR-SUP-ENG-00020894.0001001 / 17 MAR 17
Applicable to: ALL

On ground, after:
- An unsuccessful manual engine start, or
- An unsuccessful automatic start not followed by an automatic dry crank,

the flight crew can perform a dry crank cycle on the affected engine to remove the fuel vapors.

- **Before dry crank:**
  ENG MASTER (affected engine)........CHECK OFF
  ENG START sel........CHECK NORM
  ENG MAN START pb-sw (affected engine)........CHECK OFF

- **Dry crank**
  ENG START sel........CRANK
  ENG MAN START pb-sw (affected engine)........ON

Note: *To clear fuel vapors, a 30 seconds dry crank cycle is the minimum required.*

L2 Note: *A manual start sequence can be initiated following a dry crank cycle (Refer to PRO-NOR-SUP-ENG Manual Engine Start - Procedure). The flight crew should consider the starter limitations (Refer to LIM-ENG Starter).*

L1
- **When the dry crank is completed:**
  ENG MAN START pb-sw (affected engine)........OFF
  ENG START sel........NORM

ONE ENGINE TAXI

Applicable to: ALL

Ident.: PRO-NOR-SUP-ENG-B-00020525.0002001 / 03 NOV 21

GENERAL

The flight crew should be aware of the following:
- One-engine taxi reduces the aircraft systems redundancy. Therefore, the flight crew should decide to apply one-engine taxi procedures in accordance with the Operator's guidelines and the flight conditions of the day, including the aircraft status.
- One-engine taxi may require more thrust than normal. Therefore, the flight crew must be careful in order to avoid excessive jet blast and the risk of FOD.
- One-engine taxi creates fuel imbalance. Therefore, the flight crew should pay particular attention to the fuel imbalance limitation for the next takeoff.

- Taxi with engine 1 is recommended in order to pressurize the blue hydraulic system to ensure brake accumulator pressure.

  Note: *If taxi is performed with engine 2, the flight crew must check that the brake accumulator pressure on the BRAKES and ACCU PRESS indicator is normal.*

- Some operational conditions may prevent, or make more difficult one-engine taxi. The following are examples of some of these conditions:
  - Positive slope (i.e. uphill)
  - Slippery taxiway
  - High aircraft gross weight (slow or short-radius turns in the direction of the operating engine may not be possible at high gross weight).

Ident.: PRO-NOR-SUP-ENG-B-00020526.0002001 / 17 MAY 17

AT DEPARTURE

ENG 1...START

L2 *Engine 1 pressurizes the blue hydraulic system, providing brake accumulator pressure.*

L1 X BLEED...OPEN

L2 *Open the cross bleed valve in order to supply both packs with engine 1.*

L1 APPLY THE “AFTER START” NORMAL PROCEDURE, BUT:

- The APU can be kept running. In that case, switch the APU BLEED to OFF.

  L2 *The APU generator provides power to prevent electrical transients and enable galley and IFE operation. Closing the APU BLEED prevents engine exhaust gases ingestion in the air conditioning system.*

L1
- Delay the ECAM STATUS check and the wing anti-ice setting until all engines are started.

APPLY THE “TAXI” NORMAL PROCEDURE, BUT:

- Delay the flight controls check until all engines are started
- Arm the Autobrake after the flight controls check.

ENGINE WARM-UP TIME BEFORE TAKEOFF (remaining engine)..............................CONSIDER

The second engine must be started soon enough before takeoff, in order to take into account the engine start time and ensure the applicable engine warm-up time (Refer to PRO-NOR-SOP-09 After Start - ENG Start Selector).

● **For ENG 2 start:**

■ **If the APU bleed is available:**

APU BLEED...ON
ENG 2...START
X BLEED...AUTO

■ **If the APU bleed is not available:**

Refer to PRO-NOR-SUP-ENG Crossbleed Engine Start.

APU...AS RQRD

APPLY THE “AFTER START” NORMAL PROCEDURE, INCLUDING:
- ECAM STATUS check
- Selection of the ENG 2 anti-ice and wing anti-ice, as required.

AFTER START CHECKLIST...COMPLETE
FLIGHT CONTROLS...CHECK
AUTO BRK...MAX

Ident.: PRO-NOR-SUP-ENG-B-00020527.0002001 / 17 MAR 17

AT ARRIVAL

APU ....AS RQRD

L2 *If necessary, the APU can be started while taxiing and before shutting down one engine, in order to avoid additional electrical transients and enable galley and IFE operation.*

L1
- **After high thrust operations:**
  ENGINE MINIMUM COOLING TIME...CONSIDER

  Refer to PRO-NOR-SOP-22 Parking - ENG MASTER Levers.
- **When taxiing in a straight line:**

  Note: *During engine shutdown, a slight jerk forward may occur if the brakes are applied while the aircraft is moving.*

  ENG 2...SHUT DOWN
- **At parking:**
  ENG 1...SHUT DOWN

REFUELING

Ident.: PRO-NOR-SUP-FUEL-A-00021262.0034001 / 03 NOV 21
Applicable to: LV-KAN, LV-KAO

WARNING

1. Before initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft.
2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed.
3. If the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling, *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*.
4. Do not refuel in bad weather conditions and electrical storms.

PREPARATION

SAFETY PRECAUTIONS..APPLY

During refueling operations, ensure that:
- *HF transmission (including HF transmission via the HF DATA LINK pb) is not performed*
- *The aircraft is properly bonded to the tanker.*

L2 *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft*

L1 - *The external lighting is not operated (except for NAV & LOGO).*

In the cockpit, check that the PARK BRK handle is ON and that the ACCU PRESS has sufficient pressure. If the PARK BRK handle cannot be set to ON, check that the chocks are in place.

ACCESS PLATFORM..IN POSITION

HIGH LEVEL TEST:

● **From refueling control panel:**

HI LEVEL TEST sw ....PRESS

During test, HI LVL light and OVERFLOW light come on if their circuits are serviceable. CKPT light and END light come on. The fuel quantity, PRESELECTED and ACTUAL displays show the number 8 in all digits.
If there is a failure during the high level test the END light flashes and remains flashing after completion. In addition the affected HI LVL light remains on.

● **From cockpit:**

The HIGH LEVEL TEST is performed automatically when cockpit FUEL REFUEL pb is pressed. Positive test will initiate refueling. If the test fails, END light will flash.

- **If HIGH LEVEL TEST is negative:**

  A negative HIGH LEVEL TEST prevents refueling. This situation is latched until FCMC reset.

  FCMC 1 + 2 RESET button (cockpit)....................PULL then PUSH

  Note: *After FCMC reset, re-enter ZFWCG/ZFW in the INIT FUEL PRED page.*

  MANUAL REFUELING PROCEDURE....................APPLY

  Apply manual procedure with continual monitoring of refueling.

  For dispatch, refer to MEL.

Ident.: PRO-NOR-SUP-FUEL-A-00021262.0033001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

WARNING

1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft.
2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed.
3. If the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*.
4. Do not refuel in bad weather conditions and electrical storms.

PREPARATION

SAFETY PRECAUTIONS....................APPLY

During refueling operations, ensure that:
- *HF transmission (including HF transmission via the HF DATA LINK ◁ pb) is not performed*
- *The aircraft is properly bonded to the tanker*
- *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft*
- *The external lighting is not operated (except for NAV & LOGO).*

In the cockpit, check that the PARK BRK handle is ON and that the ACCU PRESS has sufficient pressure. If the PARK BRK handle cannot be set to ON, check that the chocks are in place.

ACCESS PLATFORM....................IN POSITION

HIGH LEVEL TEST:

- **From refueling control panel:**

  HI LEVEL TEST sw .... PRESS

  During test, HI LVL light and OVERFLOW light come on if their circuits are serviceable. CKPT light and END light come on. The fuel quantity, PRESELECTED and ACTUAL displays show the number 8 in all digits.
  If there is a failure during the high level test the END light flashes and remains flashing after completion. In addition the affected HI LVL light remains on.

  - **If HIGH LEVEL TEST is negative:**

    A negative HIGH LEVEL TEST prevents refueling. This situation is latched until FCMC reset.

    FCMC 1+ 2 RESET button (cockpit)... PULL then PUSH

    Note: *After FCMC reset re-enter ZFWCG/ZFW in the INIT FUEL PRED page.*

    MANUAL REFUELING PROCEDURE.. APPLY

    Apply manual procedure with continual monitoring of refueling.

    For dispatch, refer to MEL.

Ident.: PRO-NOR-SUP-FUEL-A-00021262.0015001 / 25 JUL 17
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

WARNING

1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft.
2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed.
3. If the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*.
4. Do not refuel in bad weather conditions and electrical storms.

PREPARATION

SAFETY PRECAUTIONS.. APPLY

REFUELING WITH ONE ENGINE RUNNING

Ident.: PRO-NOR-SUP-FUEL-00001479.0002001 / 21 MAR 17
Applicable to: ALL

- Refuel with one engine running, only at airports where no external ground pneumatic power is available, and only when APU is unserviceable.
- Only the RH fuel couplings can be used.
- Overwing gravity filling is not permitted.
- Disembark all passengers.
- Obtain airport authorization.
  The Airport Fire Department should standby at the aircraft during the entire refueling procedure.
- Point the aircraft into the wind, at a location where the slope is negligible.
  Set the parking brake and check its pressure.
  Run engine n° 1 at ground idle with its generator connected.
- Do not start engine n° 2, do not shut down engine n° 1, or do not attempt to start the APU before all fueling operations have been completed.
- Position the fuel truck under the extremity of the right wing. Its pressure should not exceed 50 PSI.
- Follow automatic or manual refueling procedure.

Note: *The refuel system must be fully operational.*

OPERATION MONITORING

DURING THE ENTIRE REFUELING PROCEDURE :

- Monitor the fuel truck shut-off valve.
- Be sure that the fueling company is keeping permanent control of the emergency fuel shut off device.
- Have a flight crewmember in the cockpit, to monitor all systems and the running engine.
- Have a qualified ground crewmember at the fueling station, to operate the refuel valve switches.

GROUND FUEL TRANSFER

Ident.: PRO-NOR-SUP-FUEL-00021258.0001001 / 04 SEP 19
Applicable to: ALL

WARNING

1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft.
2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed.
3. If the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*.
4. Do not operate the fuel pumps with less than 200 kg (440 lb) in the collector cells. If needed, the remaining fuel can be drained by the maintenance team via the water drain valve.

SAFETY PRECAUTIONS...APPLY

During ground operations, ensure that:

- *HF transmission is not performed (including HF transmission via the HF DATA LINK ◁ pb)*
- *If connected:*
  - *The aircraft is properly bonded to the tanker*
  - *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft*
- *The external lighting is not operated (except for NAV & LOGO).*

In the cockpit, check that the PARK BRK is ON and that the ACCU PRESS has sufficient pressure. If the PARK BRK cannot be set to ON, check that the chocks are in place.

ACCESS PLATFORM...IN POSITION

A ground transfer is possible from tank to tank, except to the trim tank.

- **On cockpit overhead FUEL panel :**

PUMPS (of the tanks not to be defueled).. OFF
PUMPS (of the tanks to be defueled).. ON

- **On refueling control panel :**

REFUEL VALVES sel (of tanks not to be filled).. SHUT
REFUEL VALVES sel (of tanks to be filled)..OPEN
MODE SELECT sw ....REFUEL
TRANSF VALVE.. OPEN

Note: *The TRANSF VALVE switch opens the left aft transfer valve only if ENG 1 main pump is on, and opens the right aft transfer valve only if the ENG 2 main pump is on.*

FUEL QTY..MONITOR

- **When the tank contents reach the required level :**
  - **On refueling control panel :**

    Corresponding REFUEL VALVES sel..SHUT
    TRANSF VALVE.. CLOSED and GUARDED
    MODE SELECT sw .... OFF and GUARDED

- **On completion of ground fuel transfer :**

REFUEL VALVES sel.. NORM and GUARDED
Cockpit FUEL panel..SET NORMAL CONFIGURATION

DEFUELING

Applicable to: ALL

Ident.: PRO-NOR-SUP-FUEL-B-00021259.0001001 / 25 JUL 17

WARNING	
WARNING	1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft. 2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed. 3. If the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*. 4. If only one hose is used for defueling, it must be connected to the coupling marked “USE THIS ADAPTOR TO DEFUEL”. 5. Do not defuel in bad weather conditions and electrical storms.

SAFETY PRECAUTIONS....................APPLY

During defueling operations, ensure that:
- *HF transmission (including HF transmission via the HF DATA LINK pb) is not performed*
- *The aircraft is properly bonded to the tanker*
- *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft*
- *The external lighting is not operated. (except for NAV & LOGO).*

In the cockpit, check that the PARK BRK is ON and that the ACCU PRESS has sufficient pressure. If the PARK BRK cannot be set to ON, check that the chocks are in place.

ACCESS PLATFORM....................IN POSITION

- **Before defueling is started:**
  - **On cockpit overhead FUEL panel:**

    PUMPS (all)....................OFF

Ident.: PRO-NOR-SUP-FUEL-B-00021260.0001001 / 20 MAR 17

DEFUELING BY SUCTION

Note:
- *Defueling all the tanks by suction is possible.*
- *If the trim tank contains fuel, then the fuel system interlocks prevent a suction defuel of the inner tanks.*

- **On refueling control panel:**

  MODE SELECT sw....................DEFUEL
  REFUEL VALVES sel (of the tanks to be defueled)....................OPEN
  FUEL QTY....................MONITOR

  - **When the tank contents reach the required level:**

    REFUEL VALVES sel....................NORM and GUARDED
    MODE SELECT sw....................OFF and GUARDED
    Cockpit FUEL panel....................SET NORMAL CONFIGURATION

Ident.: PRO-NOR-SUP-FUEL-B-00021261.0004001 / 04 SEP 19

DEFUELING WITH FUEL PUMPS

WARNING	Do not operate the fuel pumps with less than 200 kg (440 lb) in the collector cells. If needed, the remaining fuel can be drained by the maintenance team via the water drain valve.

Note: *It is only possible to defuel the inner and center tanks. To defuel the other tanks, their fuel must be first transferred to the inner tank.*

INNER TANKS

- **On refueling control panel:**
  REFUEL VALVES sel....CHECK NORM
  MODE SELECT sw....DEFUEL
  TRANSF VALVE....OPEN

  The LH (RH) aft transfer valves open provided all these conditions are met:
  - *One or more of the LH (RH) main fuel pumps is (are) on.*
  - *The trim tank is empty*
  - *The inner tank and outer tank inlet valves are closed.*

  - **On cockpit overhead FUEL panel:**
    PUMPS L1 and R1 (and L2 and R2 if greater flow needed)....ON
    FUEL QTY....MONITOR

    - **When the tank contents reach the required level:**
      Corresponding PUMPS....OFF

      Note: *When the fuel quantity in an inner tank decreases to 3 500 kg (7 716 lb) the intertank transfer valves automatically open. The fuel in the outer tanks moves to the inner tanks which can be subsequently defueled.*

- **On refueling control panel:**
  TRANSF VALVE....CLOSED and GUARDED
  MODE SELECT sw....OFF and GUARDED
  REFUEL VALVES sel....NORM and GUARDED

- **On cockpit overhead fuel panel :**
  PUMPS L and R....ON

  - **If trim tank has to be defueled**
    T TANK MODE....FWD
    FUEL QTY....MONITOR

  - **When the tank contents reach the required level :**
    Corresponding PUMPS....OFF

- **On refueling control panel :**
  MODE SELECT sw....OFF and GUARDED

REFUEL VALVES sel.. NORM and GUARDED
Cockpit FUEL panel..SET NORMAL CONFIGURATION

FROST REDUCTION ON THE UPPER WING SURFACES ABOVE THE OUTER TANKS

Ident.: PRO-NOR-SUP-FUEL-00020438.0001001 / 17 MAR 17
Applicable to: ALL

GENERAL

Wing surface temperatures may be significantly below ambient air temperature due to contact with cold fuel. These low wing surface temperatures may result in the accretion of frost on the upper wing surfaces above the outer tanks. Frost accretion may occur not only in cold weather conditions, but also at relatively high OATs, when the level of humidity is high.

CAUTION	Takeoff with frost on the upper wing surface is not permitted due to the detrimental effect on lift. The flight crew must therefore ensure that the upper wing surfaces are clean at the time of departure (*Refer to PRO-NOR-SUP-ADVWXR General*).

The flight crew should apply the following procedure, if:
- Frost accretion on the upper wing surfaces is expected
- Fuel remains in the outer tanks after landing
- Refueling is planned.

AFTER LANDING, DURING TAXI-IN:

OUTR TK XFR.. ON

CAUTION	*1. ONLY transfer fuel of the outer tanks if refueling is planned at destination. Refueling will ensure that a standard fuel distribution will be respected for the next flight.* *2. Do not manually transfer fuel of the outer tanks before landing. Fuel is required in the outer tanks in flight, in order to reduce the wing stress.*

AFTER THE OUTER TANK FUEL HAS TRANSFERRED, OR BEFORE LEAVING THE COCKPIT:

OUTR TK XFR...AUTO

L2 *If the OUTR TK XFR pb-sw is not in the AUTO position when the next refueling starts, the END light on the refuel control panel will flash and the refueling will not start. Setting the OUTR TK XFR pb-sw to AUTO will enable the refueling to start.*

Intentionally left blank

GPS INTERFERENCES

Ident.: PRO-NOR-SUP-GPSINT-A-00025192.0001001 / 26 JAN 22
Applicable to: ALL

Radio frequency interferences can affect the GPS data and the aircraft functions that use GPS data. Due to the various levels of interference, the GPS data can be maintained, degraded or lost. The associated sequence of cockpit effects cannot be predicted.
The following table provides a list of cockpit effects that may occur during the GPS interferences:

Ident.: PRO-NOR-SUP-GPSINT-A-00025201.0001001 / 26 JAN 22

XLS				Non availability of Pre-Capture Zone of the LOC Beam

Ident.: PRO-NOR-SUP-GPSINT-A-00025189.0001001 / 09 NOV 23
Applicable to: ALL

When the flight crew suspects that there is an interference on GPS due to the cockpit effects, the flight crew can check the GPS data.
The GPS MONITOR page displays dashes on GPS positions, and/or the number of tracked satellites may be lower than 5 or null, in the case of GPS interference.
The flight crew should keep the GPS selection on the SELECTED NAVAIDS page. This allows the aircraft to recover the degraded or lost functions based on GPS data (e.g. GPS PRIMARY), as soon as the aircraft is out of the interference.
When ADS-B OUT ◁ is required in the flight area, the flight crew should notify ATC of any loss of ADS-B OUT ◁ .

■ If NOTAMs (from Authority or Company) indicate a GPS interference area, and the aircraft is expected to fly in or near interference zone:

● Flight Preparation

The flight crew should consider the following:
- The possibility to identify the entry and exit points of the interference area
- The possible effects of GPS interference on flight operations
- The availability of alternate routes
- The availability of routes, procedures and approaches that do not require GPS (e.g. ILS, VOR/DME) for the affected area. *Refer to PRO-SPO-51 General - General*.

● Preliminary Cockpit Preparation

Perform a complete IRS alignment if the flight crew expects long segments in airspaces with low radio NAVAIDS coverage.

- **Before the Interference Area (Before Departure or during the Flight)**

  In order to maintain the ATC datalink communication (ADS-C, CPDLC and PBCS) and the FMS predictions, the flight crew should apply the following:

  CLOCK...INT

L2 *If the clock was previously synchronized with the GPS, the INT mode of the clock maintains the ATC datalink capabilities for 24 h.* Refer to DSC-31-55-20 Operation in Internal Mode

L1
- **After the Interference Area**

  GPS MODE..CHECK

L2 *Check that the GPS MONITOR page displays GPS 1 in NAV mode with at least 5 satellites tracked.*

L1 CLOCK...GPS

L2 *The clock should remain on INT mode until the GPS NAV mode is recovered.*

L1
■ **If no NOTAMs indicate a GPS interference area on the expected route and the flight crew suspects interference on the GPS during the flight:**

The flight crew should notify ATC of any interference on the GPS during the flight.

During the flight, the flight crew may detect an erroneous time reference due to suspected GPS interference.

In order to maintain the FMS predictions, the flight crew should consider the following:

ATC...TIME CHECK

L2 *Crosscheck the external time reference with the clock.*

L1
- **If the ATC time is different from the time displayed on the clock:**

  CLOCK...SET

  Note: *Manually enter the time data on the clock, based on the external time reference.*

  CLOCK...INT

  Note: *When the clock is switched to INT mode after manual entry in SET mode, the flight crew should consider that the ATC datalink communication (CPDLC, ADS-C and PBCS) is unavailable.* Refer to DSC-31-55-20 Operation in Internal Mode

  - **After the Interference Area**

    GPS MODE..CHECK

L2 *Check that the GPS MONITOR page displays GPS 1 in NAV mode with at least 5 satellites tracked.*

L1 CLOCK...GPS

L2 *The clock should remain in INT mode until the GPS NAV mode is recovered.*

Operation with Nosewheel Steering Offset

OPERATION WITH NOSEWHEEL STEERING OFFSET

Applicable to: ALL

Ident.: PRO-NOR-SUP-LG-LG-A-00020816.0001001 / 20 MAR 17

During taxi in a straight line, the crew may notice aircraft veering tendency. This can be due to external conditions (crosswind, slope...) or to a nosewheel steering offset.
A nosewheel steering offset is usually notified through consecutive crew reports. The NWS offset value is determined regarding the necessary rudder trim input used to cancel the veering tendency.

Ident.: PRO-NOR-SUP-LG-LG-A-00020817.0005001 / 23 OCT 18

When the NWS offset is within admissible limits, the flight crew can operate the aircraft as follows:

CAUTION	A rudder trim reset must be performed before takeoff. When the rudder trim adjustment is above the maintenance tolerance (±0.5 ° NWS offset, corresponding to the ±3 ° rudder trim necessary to taxi straight), the flight crew must systematically and accurately report the rudder trim value in the logbook.

NWS Offset	Necessary Rudder Trim Input	Procedure
Offset ≤ 0.8 °	Trim ≤ 4.5 °	● **Taxi:** RUDDER TRIM....................ADJUST Adjust trim until the aircraft taxies in a straight line. Check input value. ● **Before takeoff:** RUDDER TRIM....................RESET
0.8 ° < Offset ≤ 2 °	4.5 °< Trim ≤ 10.4 °	● **Taxi:** RUDDER TRIM....................ADJUST Adjust trim until the aircraft taxies in a straight line. Check input value. ● **Before takeoff:** RUDDER TRIM....................RESET ● **Landing:** DIFF BRK....................AS RQRD ● **For manual landing:** MAX CROSSWIND....................25 kt ● **For autoland:** MAX CROSSWIND....................14 kt
Offset > 2 °	Trim > 10.4 °	MAINTENANCE ACTION....................REQUEST Do not attempt takeoff. Request for troubleshooting.

High Altitude Airport Operations

HIGH ALTITUDE AIRPORT OPERATIONS

Ident.: PRO-NOR-SUP-MISC-A-00020513.0001001 / 05 MAY 22
Applicable to: ALL

The STANDARD OPERATING PROCEDURES and ABNORMAL and EMERGENCY PROCEDURES remain applicable for operation at high altitude airfields.

CAB PRESS SYSTEM

TAKEOFF

TAKEOFF WITH BOTH PACKS OFF : DO NOT PERFORM

L2 *Takeoff with both packs off may trigger the CAB PR EXCESS CAB ALT.*

L1 APU BLEED... AS RQRD

If required for takeoff performance, takeoff must be performed with:

- Both packs running supplied by APU bleed, *Refer to LIM-APU APU Bleed*, or
- One pack running supplied by APU bleed (if permitted), *Refer to LIM-APU APU Bleed*.

In case the aircraft takes off from an airfield higher than 8 000 ft the cabin altitude remains at takeoff altitude until the cruise conditions are fulfilled. After level off the cabin altitude is controlled to the scheduled cruise cabin altitude. On the ECAM PRESS page or CRUISE page it can be observed that the cabin altitude starts changing approximately 30 s after level off.

HYD SYSTEM

- **On ground, if the HYD Y(B)(G) RSVR LO AIR PR alert triggers:**

  Before engine start: SWITCH OFF AFFECTED HYD PUMP.

  Note: *This action allows reservoir pressurization before hydraulic pump operation.*

Intentionally left blank

Operations at QNH above 1050 hPa

GENERAL

Ident.: PRO-NOR-SUP-MISC-B-00001773.0023001 / 01 OCT 12
Applicable to: LV-KHT, LV-KHU

Some airlines may occasionally experience high barometric correction settings above 1 050 hPa, or 31.0 inHg, on some airfields. This is due to polar anticyclonic air mass conditions that occur near the polar area during winter.
The FMS, FCU, ISIS instrument, PFD, and CPCS are capable of operating at QNH/QFE up to 1 100 hPa, or 32.48 inHg.
In addition, the ATC/TCAS operates only up to 1 050 hPa (i.e. as long as the aircraft altitude remains above -1 000 ft standard pressure altitude).
Therefore, when using QNH, or QFE for QFE pin-programmed aircraft, for departure and arrival, the crew should be aware of the consequences outlined below, and should apply the corresponding procedures.
Therefore, it is necessary for the airline to obtain operational approval from its national Airworthiness Authorities.

GENERAL

Ident.: PRO-NOR-SUP-MISC-B-00001773.0046001 / 07 FEB 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Some airlines may occasionally experience high barometric correction settings above 1 050 hPa, or 31.0 inHg, on some airfields. This is due to polar anticyclonic air mass conditions that occur near the polar area during winter.
The FCU, ISIS instrument, PFD, and CPCS are capable of operating at QNH/QFE up to 1 100 hPa, or 32.48 inHg.
The FMGES is currently limited to 1 050 hPa for DEST QNH entry on the MCDU PERF APPR page (i.e. as long as the aircraft altitude remains above -1 000 ft standard pressure altitude).
In addition, the ATC/TCAS operates only up to 1 050 hPa (i.e. as long as the aircraft altitude remains above -1 000 ft standard pressure altitude).
Therefore, when using QNH, or QFE for QFE pin-programmed aircraft, for departure and arrival, the crew should be aware of the consequences outlined below, and should apply the corresponding procedures.
Therefore, it is necessary for the airline to obtain operational approval from its national Airworthiness Authorities.

CONSEQUENCES

Ident.: PRO-NOR-SUP-MISC-B-00001774.0055001 / 20 MAR 17
Applicable to: LV-KHT, LV-KHU

ON THE ATC-TCAS:

For takeoff, approach, and landing, the ATC altitude reporting and the TCAS TA/RA function may generate erroneous altitude information and nuisance TCAS alerts for other aircraft, if the aircraft standard altitude is below -1 000 ft standard pressure altitude. To avoid this, it is recommended: To set ALT RPTG to OFF, when the QNH exceed 1 050 hPa, and to inform the ATC. TCAS reverts to STBY mode.

CONSEQUENCES

Ident.: PRO-NOR-SUP-MISC-B-00001774.0053001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

ON THE ATC-TCAS:

For takeoff, approach, and landing, the ATC altitude reporting and the TCAS TA/RA function may generate erroneous altitude information and nuisance TCAS alerts for other aircraft, if the aircraft standard altitude is below -1 000 ft standard pressure altitude. To avoid this, it is recommended: To set ALT RPTG to OFF, when the QNH exceed 1 050 hPa, and to inform the ATC. TCAS reverts to STBY mode.

ON CABIN PRESSURIZATION:

The CPCS normally uses the MCDU DEST QNH value to regulate cabin pressure during descent. However, since DEST QNH entries on the MCDU are limited to 1 050 hPa, no DEST QNH value should be entered during descent preparation, in order to avoid incorrect cabin pressure regulation. As a backup, the CPCS will use the actual FCU barometric setting (when switching from STD to BARO reference).

Note: *As no DEST QNH is entered, the FMS initially assumes that Standard barometric reference will be kept down to destination for descent flight path calculations. When QNH is set on the FCU, the aircraft and cabin altitude will be higher than expected (the aircraft altitude can be up to 2 000 ft higher). This will lead to a higher descent rate, with a possible "CAB PR LO DIFF PR" ECAM caution, and possible opening of the cabin pressure safety valve.*

ON THE FMS:

DESCENT PROFILE:

In the descent phase, when the crew switches from Standard to Barometric reference, the FMS tries to catch up with an altitude increase induced by the BARO reference change. This altitude difference may be up to +2 000 ft, depending on the QNH value.
However, the FMS predictions and the VDEV remain unchanged.
Consequently, an altitude constraint just below the Descent Transition Level, may still be predicted as "satisfied", and actually flown with a positive error. This altitude difference will gradually be zeroed, as the aircraft catches up with the descent profile.

Note: *As no DEST QNH value is entered on the MCDU PERF APPR page, the FMS is unable to compute the Descent Transition Level. So, the "STD" BARO reference on the PFD will not flash when descending through the Transition Level.*

PROCEDURES

Ident.: PRO-NOR-SUP-MISC-B-00001776.0003001 / 20 MAR 17
Applicable to: LV-KHT, LV-KHU

BEFORE TAKEOFF

ALT RPTG .... OFF

L2 *ALT RPTG OFF memo and TCAS STBY memo appear on the WD.*

L1 ATC.. NOTIFY

L2 *Notify the ATC that the altitude reporting is not available.*

L1 TAKEOFF

- **Above 1 000 ft, when time permits:**

  ALT RPTG .... ON

L2 *As a result, the TCAS automatically reverts to its previous setting*

L1 APPROACH

- **Before final approach:**

L2 *As a result, the TCAS automatically reverts to its previous setting*

L1 DESCENT PREPARATION

DO NOT INSERT a DEST QNH value on the MCDU PERF APPR page.

- **For QFE use:**

  LDG ELEV .... SET TO 0

APPROACH

- **Before final approach:**

  ATC .... NOTIFY

L2 *Notify the ATC that the altitude reporting will be turned off.*

L1 ALT RPTG .... OFF

AUTOMATIC DEPENDENT SURVEILLANCE - BROADCAST (ADS-B)

Ident.: PRO-NOR-SUP-SURV-00020835.0004001 / 17 MAR 17
Applicable to: ALL

ADS-B OUT:

In some cases, the ATC ground stations can receive non valid data from the ADS-B function.
Therefore, the air traffic controller may ask the flight crew to stop the transmission of the ADS-B data (e.g. the air traffic controller requests "STOP ADS-B TRANSMISSION" or "STOP ADS-B ALTITUDE TRANSMISSION").
The flight crew cannot switch off the ADS-B automatic data transmission independently of the XPDR.
Therefore, do not switch off the ATC transponder or the altitude reporting, in order to maintain TCAS operations or Air Traffic Controller radar surveillance.
In such cases, the flight crew must refer to local Aeronautical Information Publication (AIP) to apply alternate procedure when the air traffic controller requests to stop ADS-B transmission.

ADS-B IN:

The ATSAW ◁ enables the reception of ADS-B information from other aircraft in the vicinity.
Refer to the ATSAW section.

ENHANCED GROUND PROXIMITY WARNING SYSTEM (EGPWS)

Ident.: PRO-NOR-SUP-SURV-00020863.0001001 / 01 MAR 18
Applicable to: ALL

During climb, descent, approach and go-around phases:

- **If GPS PRIMARY ◁ is not available and FMS navigation accuracy check prevents the flight crew from using NAV mode in a phase of flight:**
  TERR pb-sw...OFF

  Note: Only the basic GPWS modes 1 to 5 remain operative.

CAUTION	*Cycling the database deletes the active and secondary flight plans. Do not cycle it while airborne because doing so will delete the flight plan, eliminate all speed predictions, and blank the ND. If the aircraft is in managed speed, Green Dot becomes the speed target.*

CHECKING stored WAYPOINTS, NAVAIDS, RUNWAYS, or ROUTES

PRESS the DATA key.
PRESS the next page key [→] .

SELECT, successively, as required :
- STORED WAYPOINT
- STORED NAVAIDs
- STORED RUNWAYS
- STORED ROUTES

CHECK the contents of each of these data storages and DELETE items, as appropriate.

NAVAIDS DESELECTION

If NOTAMS indicate that selected NAVAIDs are unreliable or unserviceable, deselect them as follows:

PRESS the DATA key
SELECT THE POSITION MONITOR page
SELECT the SELECTED NAVAIDs page
Under “DESELECT”, INSERT the NAVAID identifier into the brackets.

The pilot can make only six deselections.

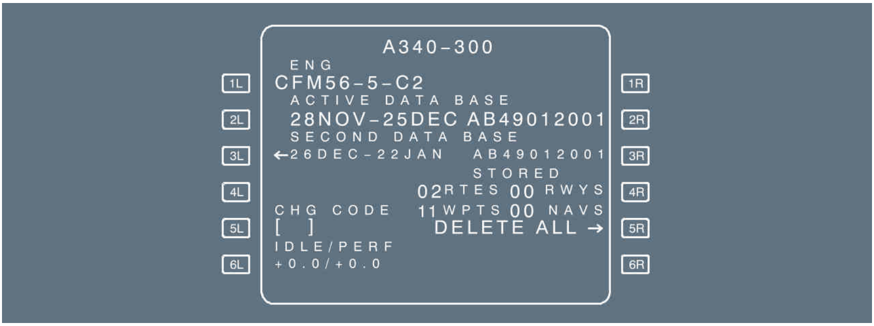
Applicable to: LV-KHT, LV-KHU

CHECKING THE CLOCK DATE

CHECK the CLOCK DATE and ADJUST if necessary.

If the date in the active database does not match the clock date, the MCDU displays “CHECK DATA BASE CYCLE”. If this message appears, check the period of validity in the second database and select it, if required.



```
              A340-300
  ENG
 CFM56-5-C2
  ACTIVE DATA BASE
  28NOV-25DEC AB49012001
  SECOND DATA BASE
←26DEC-22JAN     AB49012001
                   STORED

 CHG CODE     11WPTS 00 NAVS
 [   ]          DELETE ALL →
 IDLE/PERF
 +0.0/+0.0
```

CAUTION *Cycling the database deletes the active and secondary flight plans. Do not cycle it while airborne because doing so will delete the flight plan, eliminate all speed predictions, and blank the ND. If the aircraft is in managed speed, Green Dot becomes the speed target.*

CHECKING stored WAYPOINTS, NAVAIDS, RUNWAYS, or ROUTES

PRESS the DATA key.
PRESS the next page key [→] .

SELECT, successively, as required :
- STORED WAYPOINT
- STORED NAVAIDs
- STORED RUNWAYS
- STORED ROUTES

CHECK the contents of each of these data storages and DELETE items, as appropriate.

NAVAIDS DESELECTION

The flight crew can manually deselect all the RADIO navaids as follows:

PRESS the DATA key
SELECT the POSITION MONITOR page
SELECT the SELECTED NAVAIDs page
Press [5L] to DESELECT all the radio navaids

If NOTAMS indicate that selected NAVAIDs are unreliable or unserviceable, deselect them as follows:

PRESS the DATA key
SELECT THE POSITION MONITOR page
SELECT the SELECTED NAVAIDs page
Under “DESELECT”, INSERT the NAVAID identifier into the brackets.

The pilot can make only four deselections.

SELECT

WRITE a “FROM/TO” city pair, then ENTER it:

If one or more company routes run between the cities, the ROUTE SELECTION page appears and defines them.

INSERT the preferred company route.

- **If the database does not contain a company route:**
  The flight plan will be constructed manually:

  PRESS the INIT key.

  ENTER a city pair in the FROM/TO field.

  The ROUTE SELECTION page comes up with “NONE”.

  SELECT RETURN [6L] key, then construct the flight plan manually.

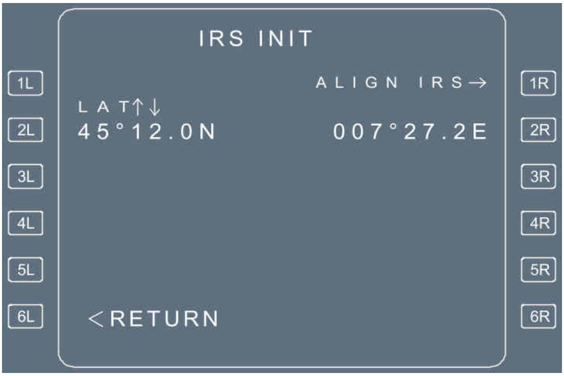
ROUTE SELECTION

If waypoints, NAVAIDs or airports are not in the NAV database, the pilot must define and store them manually, using the data “stored” function.

Ident.: PRO-NOR-SRP-01-10-A-00002452.0002001 / 07 FEB 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

ALIGNING IRS

- The pilot can enter the latitude with N or S preceding or following the value (for example, N4350.5 or 4350.5N), and the longitude with E or W preceding or following the value (for example, E00364.5 or 364.5E, W11020.3 or 11020.3W).
  Leading zeros may be omitted.



IRS INIT

ALIGN IRS→

LAT↑↓

45°12.0N

007°27.2E

<RETURN

- If the airport reference point is modified after the completion of the alignment, the MCDU displays the “RESET IRS TO NAV” message. During a stopover, it should be considered as a reminder for a quick realignment.

- **If the “RESET IRS TO NAV” message comes up later:**
  - Check the latitude and longitude, shown on the IRS INIT page, against the position of the IRSs in NAV MODE on the IRS pages (accessed via the IRS MONITOR page).
  - If these positions differ, RESET the ADIRS CDU mode by switching the selector switches OFF, and back to NAV within 5 s. (All three IRSs must be switched OFF, and then all three switched to NAV.)

Ident.: PRO-NOR-SRP-01-10-A-00002452.0005001 / 01 OCT 12
Applicable to: LV-KHT, LV-KHU

ALIGNING IRS

PRESS the INIT key, and then the IRS INIT prompt.

IRS INIT page is displayed with the airport reference point as default coordinates.

If necessary, PRESS [2L] and/or [2R] and use scroll keys to adjust the latitude and/or the longitude values.

For example, this can be used to enter the gate precise coordinates when the aircraft is intended to fly without GPS on long segments without radio coverage.

PRESS the ALIGN ON REF prompt and CONFIRM ALIGN* prompt.

The displayed coordinates are sent to ADIRS for initialization.
The alignment status changes to ALIGNING ON REF.

DEFAULTED VALUE

PRESS the F-PLN key on the MCDU.
SELECT the VERTICAL REVISION at FROM waypoint.
WRITE a new speed limit/altitude and ENTER.

The pilot can insert one climb speed limit and one descent speed limit into the vertical flight plan, or modify or clear the limits that are already in it.
The speed limit is defined by a speed and an altitude (for example, 230/9 000), which means that the managed speed target will be limited by the speed limit when the aircraft flies below the specified altitude. 250 kt at 10 000 ft is the default speed limit in the vertical flight plan in both climb and descent. The vertical revision page presents the climb speed (CLB SPD) limit if the revised waypoint belongs to a SID or is between departure and top of climb.

The vertical revision page shows the descent speed (DES SPD) limit, if the revised waypoint belongs to a standard terminal arrival route (STAR) or is between top of descent and destination.
It can be deleted by a clear action, the field reverts to brackets. It can also be cleared directly on the F-PLN A page by clearing the SPD LIM pseudo-waypoint.

                          ↑↓
```

<u>Procedure</u>

PRESS the F-PLN key on the MCDU

SELECT the VERT REV page at revised waypoint.
WRITE the speed constraint value into the scratchpad and ENTER it in 3L.
INSERT the constraint using the appropriate *CLB or DES* prompt when displayed. If CLB and DES are not displayed, insertion occurs when the value is entered in 3L.

The system displays the climb (CLB) or the descent (DES) prompt at [6L] or [6R] when the predictions are not yet available or when the waypoint is part of the cruise phase as originally defined.
When predictions are not yet available, the constraints are displayed on the F-PLN A page in magenta.

When predictions are available, the speed constraint is highlighted by a star (*).
 * If the predicted speed matches the constraint, the star is magenta.
 * If the prediction is that the aircraft will miss the speed constraint, the star is amber.
 If a speed constraint cannot be met (by more than 10 kt), the FMGES generates the message “SPD ERROR AT WPT XX”.

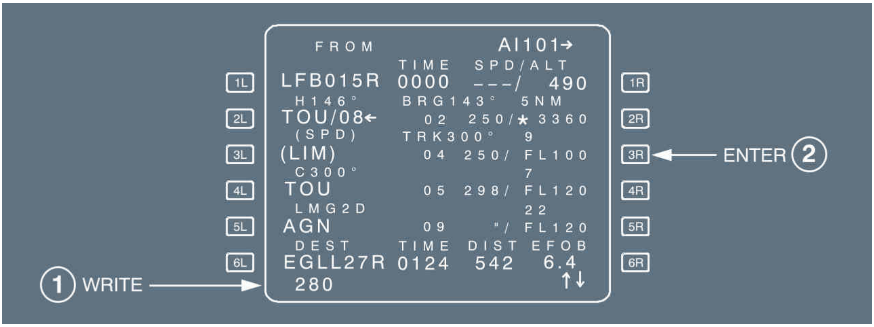
The pilot or the database may asign a speed constraint to any waypoint in the climb or the descent phase except the FROM, origin, or destination waypoints, and any pseudo waypoints.

When a speed constraint is assigned to a waypoint, the constraint will limit the managed speed target as follows:

- In takeoff or climb phase until you pass the constrained waypoint.
- In descent an approach phase, after passing the constrained waypoint.
  Speed constraints are observed by the FMGES when NAV mode and speed managed are active.

ENTERING A SPEED CONSTRAINT THROUGH F-PLN A PAGE

You may also enter a speed constraint through the F-PLN A page.



```
     FROM                         AI101→
              TIME    SPD/ALT
LFB015R      0000    ---/     490
   H146°      BRG143°    5NM
TOU/08←         02   250/*3360
   (SPD)      TRK300°    9
(LIM)           04   250/ FL100
   C300°                 7
TOU             05   298/ FL120
   LMG2D                 22
AGN             09     "/ FL120
   DEST       TIME   DIST  EFOB

2R
3R
4R
5R
6R

Procedure

PRESS the F-PLN key on the MCDU.
SELECT the "VERT REV" page at the revised waypoint.
WRITE an altitude constraint in the scratchpad and ENTER it in 3R.

INSERT the constraint using the *CLB or DES* prompt, when it is displayed. Otherwise, the value is inserted when it is entered in 3R.

*The system displays the *CLB or DES* prompt, when the predictions are not yet available, or when the waypoint is part of the cruise phase as originally defined.*

Note: *In case of QFE operations, the height constraints must be converted and entered as an altitude in feet.*

The pilot or the database may assign an altitude constraint to any waypoint in the climb or descent phases except the FROM, origin, or destination waypoints, or any pseudo waypoint.

An altitude constraint may be defined as an “at”, an “at or above”, or an “at or below” constraint. In certain procedures, the database may define an altitude constraint as a window in which the aircraft should fly.

- Enter “AT” constraints with no sign.
  Enter “AT or ABOVE” constraints preceded by a + sign (FL +130, for example).
  Enter “AT or BELOW” constraints preceded by a - sign (-15 000, for example).
  Use four digits when entering altitude. Include the lead zero (0 500 ft, for example).
  For flight level, enter a two- or three-digit number, with or without the letters “FL”. The lead zero is optional. (Examples: FL +120 or +120; FL -090 or -90 or -090)
- Enter the altitude value as either altitude or flight level; the MCDU displays the selected value as an “ALT” or “FL,” as appropriate for the transition altitude.
  The constraint must be higher than the thrust reduction altitude and lower than the cruise flight level.
  Once inserted in the flight plan, the altitude constraint (ALT CSTR) is displayed in magenta as long as predictions are not available.
  When predictions are available, the altitude constraints are replaced by the predicted altitude at relevant waypoints highlighted by a star.
  * if the predicted altitude matches the constraint the star is magenta if the predicted altitude is missed (by more than 250 ft), the star is amber.

ND Display

An altitude-constrained waypoint is marked by a circle (◯) on the navigation display.
This circle is white when the guidance does not take the altitude constraint into account.
It is magenta if the guidance system takes the altitude constraint into account and predicts that it will be matched.
It is amber if the guidance system takes the altitude constraint into account and predicts that it will not be matched.

The display automatically reverts to the F-PLN A page.
If the aircraft has not taken off by the time entered as the estimated takeoff time, the MCDU displays the “CLK IS TAKEOFF TIME” message, meaning that the system will replace your estimated takeoff time with the actual time.
When begining the takeoff roll, the system automatically adopts that clock time as the takeoff time.
If the origin airport is changed, or the clock time is invalid, the system automatically deletes the estimated takeoff time.

Applicable to: ALL

RADIO NAV

Whenever a NAVAID ident is correctly decoded, in agreement with that published, no audio check is necessary.
Morse decoding is displayed on the ND for VOR/DME, VOR/TAC, DME, NDB (ADF ◁), and on the PFD for ILS/GLS ◁ .
Preferably use the identifier for NAVAID entry.
If the NDB (ADF ◁) ident is not in the database, be sure to include a decimal point when entering the frequency (e.g. 315 or 325.7).

 6.1            0.0/0000
```

PROCEDURE

PRESS the INIT key, and the Next ("→") key to access the INIT FUEL PRED page.
ENTER the ZFW and ZFWCG value in the [1R] field.
The "FUEL PLANNING →" prompt appears in the [3R] field.

Note: *As long as the final Load and Trim Sheet is not available, the flight crew should insert the estimated ZFW/ZFWCG in order to get fuel estimates. The ZFW and ZFWCG values must be updated with the final Load and Trim Sheet values.*

CHECK/MODIFY the TAXI [1L], RTE RSV [3L] and FINAL TIME [5L] values.

The TAXI and RTE RSV and FINAL TIME fields display the default values specified in the AMI file (for example, "0.4 t" for TAXI, and "5.0 %" for RTE RSV and “0045” for FINAL TIME). The flight crew may modify these values.

Note: *At takeoff, the RTE RSV field will automatically be reset to 0. The RTE RSV fuel is then added to the EXTRA fuel, which ensures that the EXTRA fuel and MIN DEST FOB values are consistent in flight.*

ENTER an ALTN fuel value in the [4L] field, as necessary.

The flight crew may enter the ALTN fuel value planned on the Computerized Flight Plan (CFP), as necessary.

ENTER a MIN DEST FOB value in the [6L] field, as necessary.

Note: *MIN DEST FOB (equal to ALTN + FINAL) can be increased at flight crew discretion (e.g. when HOLD is expected at destination).*

ENTER the TRIP WIND value in the [5R] field, as necessary.

If no wind profile has been entered in the F-PLN, the flight crew may enter an average TRIP WIND in this field, to obtain more realistic fuel/time predictions before departure.

Note:

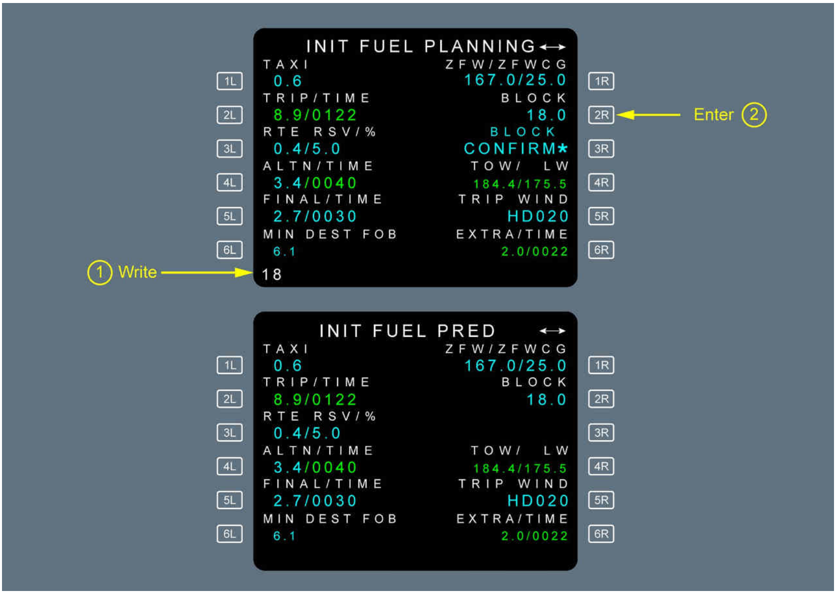
1. *The flight crew should only enter a TRIP WIND to obtain realistic fuel/time predictions, on ground. Then, the flight crew should enter a wind profile using the WIND pages, for fuel/time predictions in flight. As soon as the flight crew has entered a wind profile on the WIND pages, the TRIP WIND will be erased.*
2. *If the flight crew has already defined a wind profile, even partially (such as climb wind), it is not possible to enter a TRIP WIND.*

ENTER the planned BLOCK fuel, as indicated in the Computerized Flight Plan (CFP).

If the planned BLOCK fuel is not available, the flight crew may obtain a prediction of the minimum BLOCK fuel required for the flight by pressing the FUEL PLANNING prompt [3R].
Pressing this prompt makes the FMS compute the minimum required BLOCK fuel, which is the BLOCK fuel required to have EXTRA fuel equal to 0, based on the parameters entered on the INIT and F-PLN pages.
The computed BLOCK fuel value is displayed in the [2R] field, and a BLOCK CONFIRM prompt appears in the [3R] field.*

Note: *In order to obtain a realistic fuel computation, the flight crew should ensure that the F-PLN initialization has been completed (including insertion of the ALTN F-PLN and/or ALTN fuel, if necessary), and that flight parameters, such as CRZ FL, steps climbs (if any), and winds, have been inserted.*

- **When the final LTS data are available:**



```
         INIT FUEL PLANNING ↔
TAXI                        ZFW/ZFWCG
 0.6                       167.0/25.0
TRIP/TIME                       BLOCK
 8.9/0122                        18.0
RTE RSV/%                       BLOCK
 0.4/5.0                     CONFIRM*
ALTN/TIME                     TOW/ LW
 3.4/0040                 184.4/175.5
FINAL/TIME                  TRIP WIND
 2.7/0030                       HD020
MIN DEST FOB               EXTRA/TIME
 6.1                        2.0/0022
18
```

```
           INIT FUEL PRED   ↔
TAXI                        ZFW/ZFWCG
 0.6                       167.0/25.0
TRIP/TIME                       BLOCK
 8.9/0122                        18.0
RTE RSV/%
 0.4/5.0
ALTN/TIME                     TOW/ LW
 3.4/0040                 184.4/175.5
FINAL/TIME                  TRIP WIND
 2.7/0030                       HD020
MIN DEST FOB               EXTRA/TIME
 6.1                        2.0/0022
```

ENTER the final ZFW/ZFWCG [1R], and the required BLOCK fuel [2R].

The FMGEC computes the predictions, based on the entered BLOCK fuel, and estimates the EXTRA fuel value.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.

If necessary, the flight crew may modify the ALTN or FINAL fuel values.

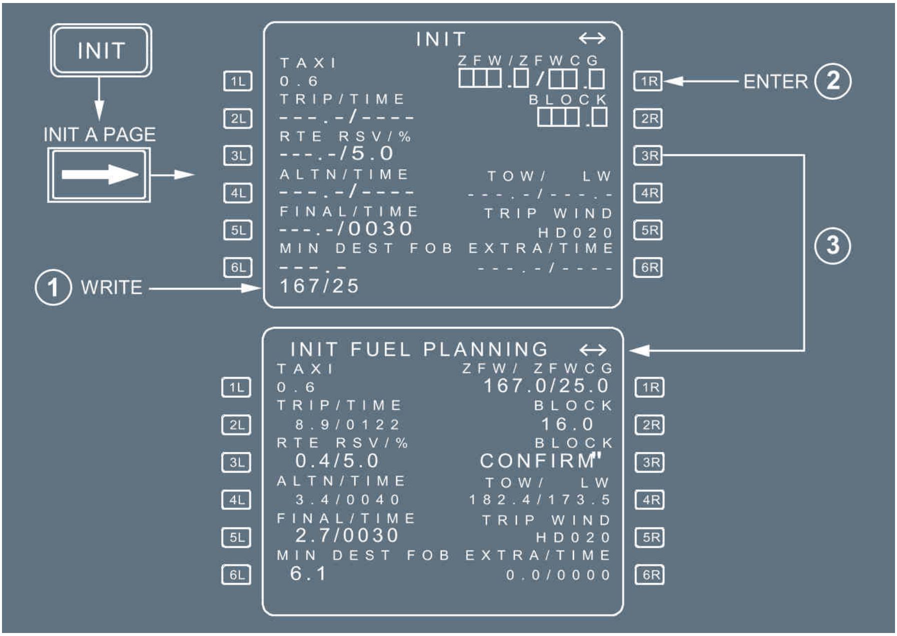
PRINT the PREFLIGHT REPORT, if necessary.

When the final Load and Trim Sheet values (ZFW/ZFWCG/BLOCK) have been entered, the flight crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

Ident.: PRO-NOR-SRP-01-10-B-00002458.0005001 / 05 OCT 16
Applicable to: LV-KHT, LV-KHU

WEIGHT/CG INSERTION AND FUEL PLANNING

The flight crew must enter the Zero Fuel Weight (ZFW) and Zero Fuel Weight Center of Gravity (ZFWCG) values on the INIT B page, to allow the FMS to perform the fuel planning computations.



```
INIT                      ↔
TAXI               ZFW/ZFWCG
0.6              □□□.□/□□.□

 8.9/0122               16.0
RTE RSV/%              BLOCK
 0.4/5.0            CONFIRM*
ALTN/TIME            TOW/  LW
 3.4/0040        182.4/173.5
FINAL/TIME         TRIP WIND
 2.7/0030              HD020
MIN DEST FOB      EXTRA/TIME
 6.1                0.0/0000
```

PROCEDURE

PRESS the INIT key, and the Next ("→") key to access the INIT B page.

ENTER the ZFW and ZFWCG value in the [1R] field.

The "FUEL PLANNING →" prompt appears in the [3R] field.

Note: As long as the final Load and Trim Sheet is not available, the flight crew should insert the estimated ZFW/ZFWCG in order to get fuel estimates. The ZFW and ZFWCG values must be updated with the final Load and Trim Sheet values.

CHECK/MODIFY the TAXI [1L], RTE RSV [3L] and FINAL TIME [5L] values.

The TAXI and RTE RSV and FINAL TIME fields display the default values specified in the AMI file (for example, "0.4 t" for TAXI, and "5.0 %" for RTE RSV and "0045" for FINAL TIME). The flight crew may modify these values.

Note: At takeoff, the RTE RSV field will automatically be reset to 0. The RTE RSV fuel is then added to the EXTRA fuel, which ensures that the EXTRA fuel and MIN DEST FOB values are consistent in flight.

ENTER an ALTN fuel value in the [4L] field, as necessary.

The flight crew may enter the ALTN fuel value planned on the Computerized Flight Plan (CFP), as necessary.

ENTER a MIN DEST FOB value in the [6] field, as necessary.

Note: *MIN DEST FOB (equal to ALTN + FINAL) can be increased at flight crew discretion (e.g. when HOLD is expected at destination).*

ENTER the TRIP WIND value in the [5R] field, as necessary.

If no wind profile has been entered in the F-PLN, the flight crew may enter an average TRIP WIND in this field, to obtain more realistic fuel/time predictions before departure.

Note:

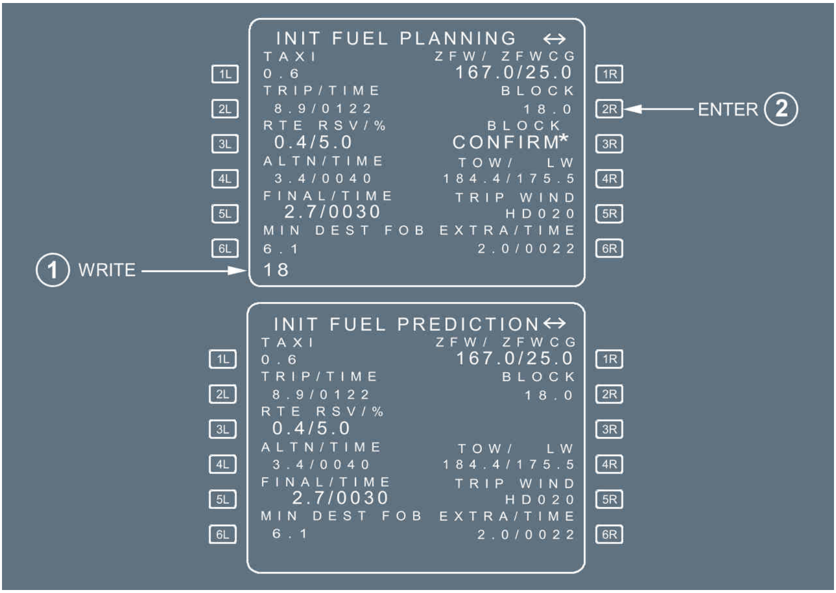
1. *The flight crew should only enter a TRIP WIND to obtain realistic fuel/time predictions, on ground. Then, the flight crew should enter a wind profile using the WIND pages, for fuel/time predictions in flight. As soon as the flight crew has entered a wind profile on the WIND pages, the TRIP WIND will be erased.*
2. *If the flight crew has already defined a wind profile, even partially (such as climb wind), it is not possible to enter a TRIP WIND.*

ENTER the planned BLOCK fuel, as indicated in the Computerized Flight Plan (CFP).

If the planned BLOCK fuel is not available, the flight crew may obtain a prediction of the minimum BLOCK fuel required for the flight by pressing the FUEL PLANNING prompt [3R]. Pressing this prompt makes the FMS compute the minimum required BLOCK fuel, which is the BLOCK fuel required to have EXTRA fuel = 0, based on the parameters entered on the INIT and F-PLN pages.
The computed BLOCK fuel value is displayed in the [2R] field, and a BLOCK CONFIRM prompt appears in the [3R] field.

Note: *In order to obtain a realistic fuel computation, the flight crew should ensure that the F-PLN initialization has been completed (including insertion of the ALTN F-PLN and/or ALTN fuel, if necessary), and that flight parameters, such as CRZ FL, steps climbs (if any), and winds, have been inserted.*

- **When the final Load and Trim Sheet (LTS) data are available:**



```
INIT FUEL PLANNING      ↔
TAXI            ZFW/ ZFWCG
0.6             167.0/25.0

8.9/0122              18.0
RTE RSV/%            BLOCK
0.4/5.0           CONFIRM*
ALTN/TIME         TOW/  LW
3.4/0040       184.4/175.5
FINAL/TIME       TRIP WIND
2.7/0030             HD020
MIN DEST FOB    EXTRA/TIME
6.1               2.0/0022
18
```

```
INIT FUEL PREDICTION    ↔
TAXI            ZFW/ ZFWCG
0.6             167.0/25.0
TRIP/TIME            BLOCK
8.9/0122              18.0
RTE RSV/%
0.4/5.0
ALTN/TIME         TOW/  LW
3.4/0040       184.4/175.5
FINAL/TIME       TRIP WIND
2.7/0030             HD020
MIN DEST FOB    EXTRA/TIME
6.1               2.0/0022
```

ENTER the final ZFW/ZFWCG [1R], and the required BLOCK fuel [2R].

The FMGEC computes the predictions, based on the entered BLOCK fuel, and estimates the EXTRA fuel value.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.

If necessary, the flight crew may modify the ALTN or FINAL fuel values.

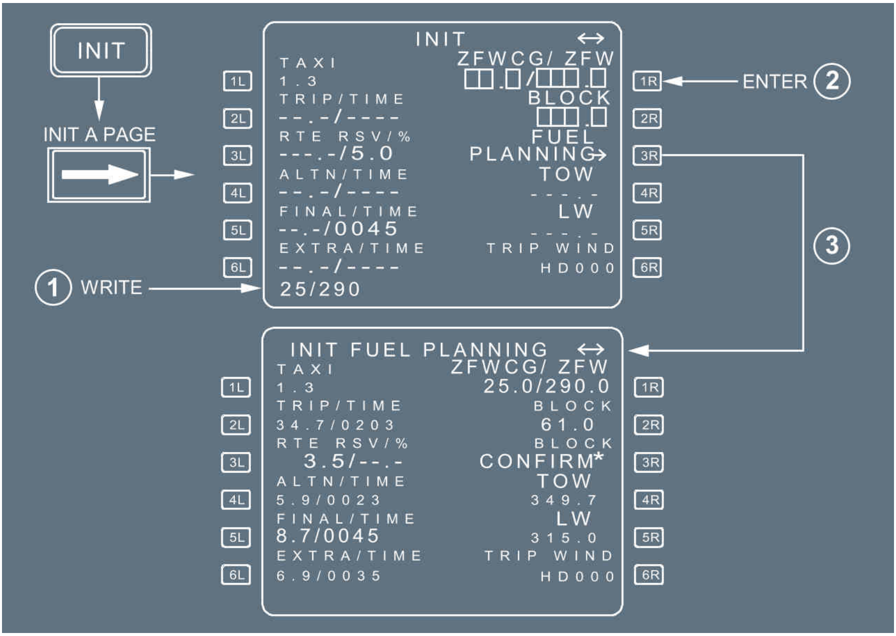
PRINT the PREFLIGHT REPORT, if necessary.

When the final Load and Trim Sheet values (ZFW/ZFWCG/BLOCK) have been entered, the flight crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

Ident.: PRO-NOR-SRP-01-10-B-00002458.0002001 / 05 OCT 16
Applicable to: LV-GKO, LV-GKP

WEIGHT/CG INSERTION AND FUEL PLANNING

The flight crew must enter the Zero Fuel Weight (ZFW) and Zero Fuel Weight Center of Gravity (ZFWCG) values on the INIT B page, to allow the FMS to perform the fuel planning computations.



```
              INIT      ↔

TRIP/TIME             BLOCK
34.7/0203              61.0
RTE RSV/%             BLOCK
  3.5/--.-         CONFIRM*
ALTN/TIME               TOW
5.9/0023              349.7
FINAL/TIME               LW
8.7/0045              315.0
EXTRA/TIME        TRIP WIND
6.9/0035              HD000
```

PROCEDURE

PRESS the INIT key, and the Next ("→") key to access the INIT B page.

ENTER the ZFWCG and ZFW value in the [1R] field.

The "FUEL PLANNING →" prompt appears in the [3R] field.

Note: *As long as the final loadsheet is not available, the flight crew should insert the estimated ZFWCG/ZFW in order to get fuel estimates. The ZFWCG and ZFW values must be updated with the final loadsheet values.*

CHECK/MODIFY the TAXI [1L] and RTE RSV [3L] values.

The TAXI and RTE RSV fields display the default values specified in the AMI file (for example, "0.4 t" for TAXI, and "5.0 %" for RTE RSV). The flight crew may modify these values.

CHECK/MODIFY the TRIP WIND value in the [6R] field.

If no wind profile has been entered in the F-PLN, the flight crew may enter an average TRIP WIND in this field, to have more realistic fuel/time predictions.

Note: *1. If the flight crew has already defined a wind profile, even partially (such as climb wind), it is not possible to enter a TRIP WIND.*
2. If the flight crew enters a TRIP WIND, and subsequently enters a wind profile on the WIND pages, the TRIP WIND will be deleted, and the FMS will use the wind profile defined on the WIND pages for predictions computations.

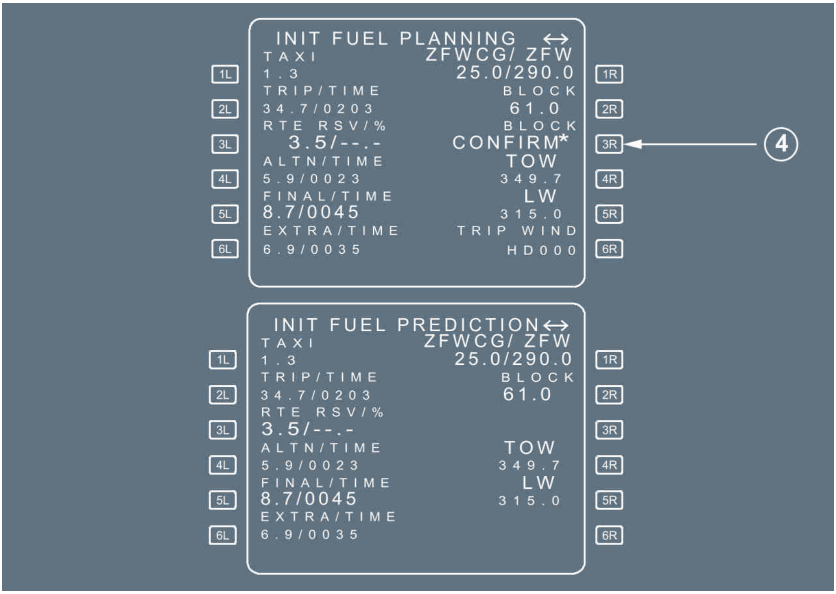
PRESS the FUEL PLANNING prompt [3R].

The FMS computes the required BLOCK fuel in order to have EXTRA fuel = 0, based on the parameters entered on the INIT and F-PLN pages. The computed BLOCK fuel value is displayed in the [2R] field, and a BLOCK CONFIRM prompt appears in the [3R] field.

Note: *In order to obtain a realistic BLOCK fuel computation, the flight crew should ensure that the F-PLN initialization has been completed (including ALTN if necessary), and that flight parameters, such as CRZ FL, steps climbs (if any), and winds, have been inserted, before using the FUEL PLANNING function.*

The flight crew must check the FMS-computed BLOCK fuel value against the actual block fuel required for the flight. Fuel planning must not be based only on FMS predictions.

- **If the computed BLOCK fuel corresponds to the actual block fuel required for the flight:**



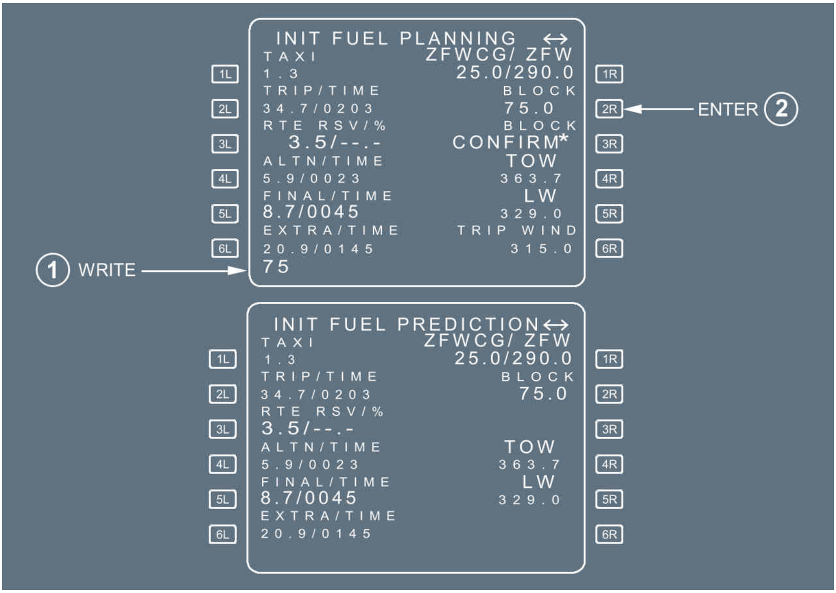
```
 INIT FUEL PLANNING    ↔
TAXI            ZFWCG/ ZFW
1.3             25.0/290.0
TRIP/TIME            BLOCK
34.7/0203             61.0
RTE RSV/%            BLOCK
 3.5/--.-          CONFIRM*
ALTN/TIME              TOW
5.9/0023             349.7
FINAL/TIME              LW
8.7/0045             315.0
EXTRA/TIME       TRIP WIND
6.9/0035             HD000
```

```
 INIT FUEL PREDICTION↔
TAXI            ZFWCG/ ZFW
1.3             25.0/290.0
TRIP/TIME            BLOCK
34.7/0203          61.0
RTE RSV/%
3.5/--.-
ALTN/TIME              TOW
5.9/0023             349.7
FINAL/TIME              LW
8.7/0045             315.0
EXTRA/TIME
6.9/0035
```

PRESS the BLOCK CONFIRM prompt [3R].

The FMS computes all the predictions, based on the computed BLOCK fuel.

- **If the computed BLOCK fuel does NOT correspond to the actual block fuel required for the flight:**



```
INIT FUEL PLANNING     ↔
TAXI          ZFWCG/ ZFW
1.3           25.0/290.0
TRIP/TIME          BLOCK
34.7/0203           75.0
RTE RSV/%          BLOCK
3.5/--.-        CONFIRM*
ALTN/TIME            TOW
5.9/0023           363.7
FINAL/TIME            LW
8.7/0045           329.0
EXTRA/TIME     TRIP WIND
20.9/0145          315.0
75
```

```
INIT FUEL PREDICTION   ↔
TAXI          ZFWCG/ ZFW
1.3           25.0/290.0
TRIP/TIME          BLOCK
34.7/0203           75.0
RTE RSV/%
3.5/--.-
ALTN/TIME            TOW
5.9/0023           363.7
FINAL/TIME            LW
8.7/0045           329.0
EXTRA/TIME
20.9/0145
```

ENTER the desired BLOCK fuel in the [2R] field.

The FMS computes the predictions, based on the entered BLOCK fuel, and estimates the EXTRA fuel value.

- **When the BLOCK fuel has been entered:**

CHECK/MODIFY the FINAL/TIME [5L] values.

If the flight crew modifies the FINAL or TIME values, the EXTRA fuel value will be modified accordingly.

Note:
- *The ALTN value computed by the FMS may differ from the value retained on the operational flight plan, since some computation hypothesis (such as, for example, the route, wind profile, CRZ FL, CI) may differ.*
- *The system computes part of the characteristics speeds displayed on the PFD (VLS, F, S, Green Dot) from the ZFWCG and ZFW entered by the flight crew on the MCDU (used by the fuel computer FCMC to compute the aircraft GW and CG). Therefore, the flight crew must carefully check these data.*

PRINT the PREFLIGHT REPORT, if necessary

When the final loadsheet values (ZFWCG/ZFW/BLOCK) have been entered, and the FUEL PLANNING is completed, the flight crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

Ident.: PRO-NOR-SRP-01-10-B-00002459.0001001 / 16 NOV 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

TAKEOFF WITH NO GROSS WEIGHT ENTRY - GROSS WEIGHT LOST BY THE FMGES

If a GW is not entered, or if the FMGES loses the value due to a power interruption, managed speed will be only available for the takeoff phase (and providing V2 has been inserted).
After engine start, the MCDU displays “INITIALIZE WEIGHTS”.

If the pilot does not respond, the following occurs :
- At takeoff, the speed reference system (SRS) mode remains active until the aircraft reaches the acceleration altitude (ACC ALT), or engages another vertical mode .
- When the aircraft leaves the SRS mode, the target speed becomes the current speed and is no longer managed.

● **To regain a normal speed target, the pilot must :**

SELECT the appropriate climb speed on the FCU and PULL the knob.

INSERT GW on the FUEL PRED page.

PUSH the SPD selector knob on the FCU to get managed speed.

Ident.: PRO-NOR-SRP-01-10-B-00002459.0002001 / 01 OCT 12
Applicable to: LV-KHT, LV-KHU

TAKEOFF WITH NO WEIGHT/CG DATA

If the crew does not enter ZFW/ZFWCG data prior takeoff, or if the FMGEC looses these values due to a power interruption, the following will occur:
- At takeoff, the Speed Reference System (SRS) mode is available (provided a V2 has been inserted).
- When the aircraft leaves the SRS mode, the target speed becomes the current speed and reverts to selected.

Note: *If the AP/FD has reverted to ALT or V/S (FPA) mode, the associated A/THR mode is SPEED. In that case, the system will probably reduce thrust, because the speed will be equal to or greater than the target speed.*

- **When appropriate, to regain FMS predictions and associated managed modes:**
  INSERT the ZFW/ZFWCG values on the FUEL PRED page.

Ident.: PRO-NOR-SRP-01-10-B-00002460.0003001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

INSERTING WEIGHT/CG DATA AFTER ENGINE START

The flight crew must enter the ZFW/ZFWCG values on INIT FUEL PRED page prior to engine start. If these data have not been entered at engine start, the MCDU displays the INITIALIZE ZFW/ZFWCG message in the scratchpad. After engine start, the flight crew should enter the ZFW/ZFWCG values on the FUEL PRED page.

PRESS the FUEL PRED key.
INSERT the ZFW/ZFWCG values in the [4R] field.

This allows predictions and performance computation.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.

If necessary, the flight crew may modify the ALTN or FINAL fuel values.

PRINT the PREFLIGHT REPORT, if necessary.

When the final load sheet values (ZFW/ZFWCG/BLOCK) have been entered, the flight crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

Ident.: PRO-NOR-SRP-01-10-B-00002460.0001001 / 07 FEB 11
Applicable to: LV-GKO, LV-GKP

INSERTING GW AND CG AFTER ENGINE START

The flight crew must enter the ZFWCG and ZFW on the INIT B page before engine start. After engine start, the crew can enter GW and CG values, on the FUEL PRED page.

PRESS the FUEL PRED key.
INSERT GW. This allows predictions and performance computation.
MODIFY CG, if necessary. The CG is defaulted to 25 %.

The FCMC (or the Flight Envelope part of the FMGEC as backup) continuously updates and sends gross weight and center of gravity in flight.

Ident.: PRO-NOR-SRP-01-10-B-00002460.0002001 / 01 OCT 12
Applicable to: LV-KHT, LV-KHU

INSERTING WEIGHT/CG DATA AFTER ENGINE START

The flight crew must enter the ZFW/ZFWCG values on INIT B page prior to engine start. If these data have not been entered at engine start, the MCDU displays the "INITIALIZE ZFW/ZFWCG" amber message in the scratchpad. After engine start, the crew should enter the ZFW/ZFWCG values on the FUEL PRED page.

PRESS the FUEL PRED key.
INSERT the ZFW/ZFWCG values in the [4R] field.

This allows predictions and performance computation.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.

If necessary, the flight crew may modify the ALTN or FINAL fuel values.

PRINT the PREFLIGHT REPORT, if necessary.

When the final load sheet values (ZFW/ZFWCG/BLOCK) have been entered, the crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

WRITE
1
2
ENTER

PROCEDURE

PRESS the PERF key on the MCDU.
PRESS the NEXT key to display CLB page.
WRITE the desired derated climb level (D1 or D2) in the scratchpad.
PRESS the [1R] key to ENTER the derated climb level.

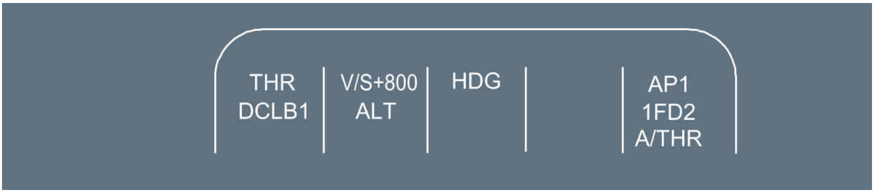
The derated climb level may be inserted/modified/cleared in the MCDU at any moment in PREFLIGHT, TAKEOFF, CLIMB or GO AROUND phases only.

DERATED CLIMB ACTIVATION

The derated climb becomes active when:
- A derated climb level is inserted in the FMGES,
- The thrust levers are set in the CL detent,
- The FMGS is in climb phase.

If there is more than one climb phase (e.g. step climbs), the derated climb is only available on the first climb phase.
The derated climb function does not depend on autothrust, autopilot or flight director engagement.

When the derated climb mode is active, the EWD displays DCLB1(2) thrust rating limit (depending on inserted level D1 or D2) and the associated Thrust Limit Value.
If the A/THR is also active, THR DCLB 1(2) appears in the first column of the FMA.



THR
DCLB1
V/S+800
ALT
HDG
AP1
1FD2
A/THR

DERATED CLIMB DE-ACTIVATION

The derated climb is canceled when:

- The MCDU derated climb level is cleared by the pilot, or
- The FMGES leaves the climb phase, or
- At least one of the thrust levers is set to MCT or above, or
- The slats are extended in flight.

Ident.: PRO-NOR-SRP-01-10-B-00002462.0001001 / 09 OCT 12
Applicable to: ALL

CLIMB SPEED PRESELECTION

If the managed speeds for the initial climb are not suitable, the pilot can preselect an appropriate climb speed on the “PERF CLB” page as long as the climb phase is not active.

The CLB SPD preselection applies when:

- ATC specifies an initial climb speed.
- The initial climb speed must be lower than normal because:
  - There will be turned greater than 120 ° in the initial climb.
  - Obstacle clearance or some other situation requires a high climb angle.
  - The airfield has a risk area to be cleared expeditiously (birds reported, for example).

                   STEP ALTS>
 PREV                  NEXT
<PHASE                PHASE>
 210
```

PROCEDURE

PRESS the PERF key on MCDU
PRESS the NEXT PAGE on MCDU
WRITE a climb speed and ENTER it in [4L]
To revert to managed speed, select MANAGED by pressing [3L] key.

When the aircraft is transitioning into the climb phase, the preselected value becomes the target speed:

- *The selected speed target is active*
- *The primary flight display shows the target speed in blue*
- *The speed window of the FCU displays the new speed or Mach number.*

Ident.: PRO-NOR-SRP-01-10-B-00002463.0001001 / 09 OCT 12
Applicable to: ALL

CRUISE MACH (SPEED) PRESELECTION

The pilot preselects a cruise Mach when it requires a Mach number other than the economy cruise Mach number.
When the aircraft transitions to the cruise phase, the speed target symbol goes to the preselected value and MACH (or SPD) becomes selected (blue target on PFD, target MACH shown in the speed/Mach window of the FCU).

  MACH SEL:.80
```

PROCEDURE

PRESS the PERF key on MCDU
PRESS the NEXT PAGE key on MCDU until the CRZ page is accessed.
WRITE a cruise Mach (or speed) into the scratchpad and ENTER it in [4L].
To revert to managed speed, PRESS the [3L] key.

The pilot may modify the cruise Mach or speed on ground or in climb. When the cruise phase is active, the pilot cannot preselect a cruise Mach or speed.

Applicable to: ALL

ENTERING A HEADING/TRACK PRESET FUNCTION

The heading/track preset allows the flight crew to preset a heading or a track for takeoff or goaround before the flight crew commands the aircraft to take up that heading or track (manual activation).
The flight crew can enter a heading or a track preset while the aircraft is on the ground and until takeoff.

PROCEDURE

Before takeoff:

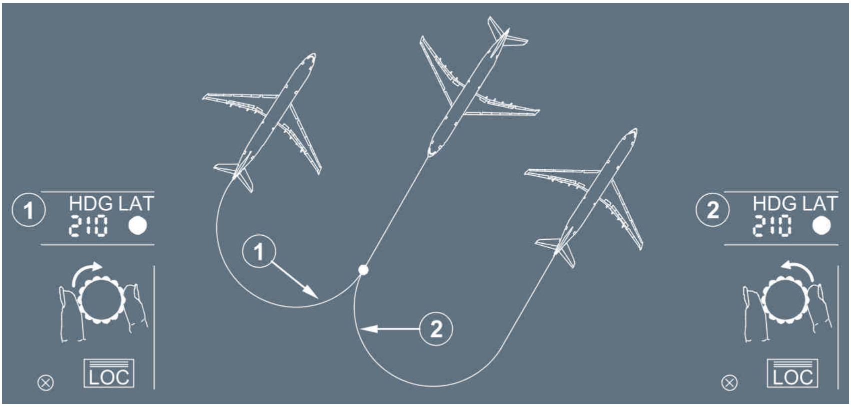
SET the appropriate HDG or TRK in the FCU window.

This disarms the navigation mode and allows the runway mode to remain engaged after takeoff.

To activate the preset after takeoff:

PULL the HDG/TRK selector knob.

The heading or track mode engages on the preset value.



The direction the flight crew rotates the HDG/TRK selection knob usually determines the direction of the turn. A left rotation (decreasing heading) produces a left turn; a right rotation produces a right turn.
However, when a heading has been preset before takeoff or a go-around, the direction of the turn will be such as to cause the shortest turn at the moment of engagement.

CANCELLING THE HEADING/TRACK PRESET FUNCTION

The flight crew can cancel the heading preset by pushing the HDG/TRK selector knob back in again. This makes the navigation mode engage or arm.

FMGES RE-INITIALIZATION AFTER A CANCELED FLIGHT

Ident.: PRO-NOR-SRP-01-10-00013001.0004001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

If the flight crew initially prepared a flight with all the data associated with this flight (takeoff speeds, winds, etc.), and if this flight is later canceled and replaced by another flight, the flight crew may use the following procedure to initialize the FMGES again:

PREPARE the new flight data in the secondary flight plan, using SEC INIT A, SEC INIT FUEL PRED, and SEC PERF pages.
ACTIVATE the secondary flight plan.

Note: *When the flight crew activates the secondary flight plan, the following data of the primary flight plan is lost if the secondary flight plan does not include any replacement data:*
- *Alternate data*
- *Winds and cruise temperature at waypoints as inserted on CRUISE WIND pages*
- *Departure and arrival selection (STAR, APP, RWY) and approach parameters (QNH, TEMP, WIND, TRANS ALT, VAPP, MDA/MDH, DH, LDG CONF)*
- *Altitude, speed, and time constraints*
- *Steps*
- *CMS*
- *Offsets*
- *Flaps/THS*
- *Preselected cruise and descent speeds.*

FMGES RE-INITIALIZATION AFTER A CANCELED FLIGHT

Ident.: PRO-NOR-SRP-01-10-00013001.0001001 / 16 NOV 11
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

If the flight crew initially prepared a flight with all the data associated with this flight (takeoff speeds, winds, etc.), and if this flight is later canceled and replaced by another flight, the flight crew may use the following procedure to initialize the FMGES again:

PREPARE the new flight data in the secondary flight plan, using SEC INIT A, SEC INIT B, and SEC PERF pages
ACTIVATE the secondary flight plan

Note: *When the flight crew activates the secondary flight plan, the following data of the primary flight plan is lost if the secondary flight plan does not include any replacement data:*
- *Alternate data*
- *Winds and cruise temp at waypoints as inserted on CRZ WIND pages*
- *Departure and arrival selection (STAR, APP, RWY) and approach parameters (QNH, TEMP, WIND, TRANS ALT, VAPP, MDA/MDH, DH, LDG CONF)*

F-PLN A PAGE AFTER
TMPY F-PLN INSERTION

PROCEDURE

PRESS the F-PLN key on the MCDU.
SELECT the LAT REV at origin.
SELECT the DEPARTURE prompt [1L].
SELECT the new RWY in use.

The “CHECK TAKEOFF DATA” message is displayed.

CHECK/SELECT the appropriate SID and TRANS.
CHECK and INSERT the TMPY F-PLN, or continue with next revision.
PRESS the PERF key to access PERF TAKEOFF page.
CHECK the V1, VR, V2, and FLEX values displayed after the amber boxes. If these values are correct, PRESS [6R] to confirm and insert them. Else, ENTER new values.

ENTER the new V1, VR, V2, FLEX TEMP (or derated level) or CONF, as appropriate.

The previously entered values, adjacent to the boxes, may be re-selected by pressing the CONFIRM TO DATA prompt on [6R].*

Note:
1. *In case of a runway change, any previous lateral modification performed on the active DEPARTURE procedure may lead to additional waypoint stacking in the temporary F-PLN. The flight crew has to revise it, as necessary.*
2. *If the previously selected SID is compatible with the new runway, it automatically appears in the temporary flight plan. Any revision the flight crew may have made to the previous SID will not be transferred*
   If the flight crew still wants it, the flight crew has to reenter it.

TAKEOFF FROM INTERSECTION

Ident.: PRO-NOR-SRP-01-15-00002466.0001001 / 10 DEC 09
Applicable to: ALL

Use RTOW or FCOM to revise takeoff parameters
PRESS the [PERF] key on MCDU
ENTER the takeoff shift
ENTER the new V1, VR, V2, FLX TEMP (or derated level), or CONF, as appropriate

Note: *The insertion of the shift in takeoff position permits the system to make an accurate revision to its navigation data at takeoff.*

TAKEOFF

MONITORING THE TAKEOFF

Ident.: PRO-NOR-SRP-01-30-00002471.0001001 / 09 OCT 12
Applicable to: ALL

- **At power set (thrust levers in FLX or TOGA position)**

  CHECK that the navigation is updated to the runway threshold by verifying that the aircraft symbol is centered on the runway threshold of the navigation display.

  CHECK the FMA for appropriate mode selection

  Note:
  - *RWY mode appears if an ILS is tuned to a station corresponding to the departure runway. Otherwise no lateral mode comes up until the aircraft has lifted off.*
  - *Until the aircraft is airborne, do not rely on the wind displayed on the NDs.*

020

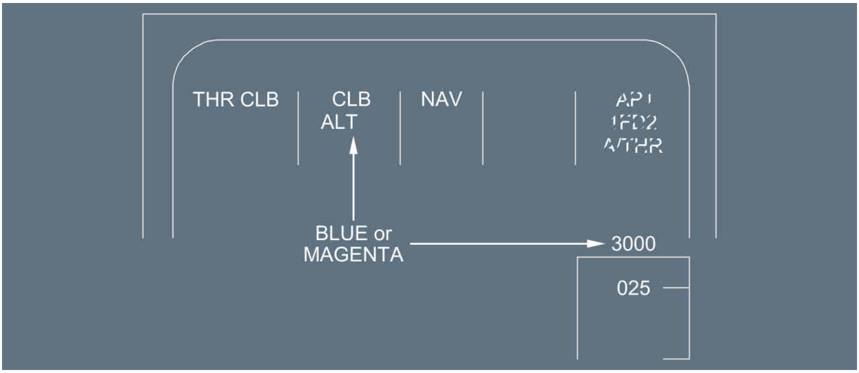
Depending on the next level off altitude, CLB or ALT is armed and displayed in the second column.

ALT is armed :
- *In blue, if the next predicted level-off is the FCU-selected altitude (target altitude blue at the top of the ALT scale).*
- *In magenta, if the next predicted level-off is an ALT CSTR (target altitude magenta at the top of the ALT scale).*

● **At acceleration altitude**

The vertical phase automatically switches to climb.

CLB mode engages. The target speed jumps to initial climb speed on the PFD.



PROCEDURE

CHECK that “CLB” appears in green in the second FMA column.

- *The speed reference system (SRS) mode remains engaged until CLB phase is engaged, which occurs at ACCEL ALT or at any other vertical mode engagement, whichever comes first.*
- *If during takeoff the FCU altitude is set below the current aircraft altitude, the system ignores the FCU altitude and the aircraft remains in SRS mode until the pilot selects an altitude above the aircraft altitude or engages any other mode.*

PRESELECTING HEADING OR TRACK

Ident.: PRO-NOR-SRP-01-30-00002472.0001001 / 18 MAR 11
Applicable to: ALL

PROCEDURE

● **If a HDG or a TRK was preselected on the ground :**

PULL OUT the HDG/TRK selector knob when required

CHECK that the HDG/TRK mode is active and displayed on the FMA

When a HDG or TRK is preset, OP CLB mode will engage at the acceleration altitude. (CLB mode is not available in HDG/TRK mode).

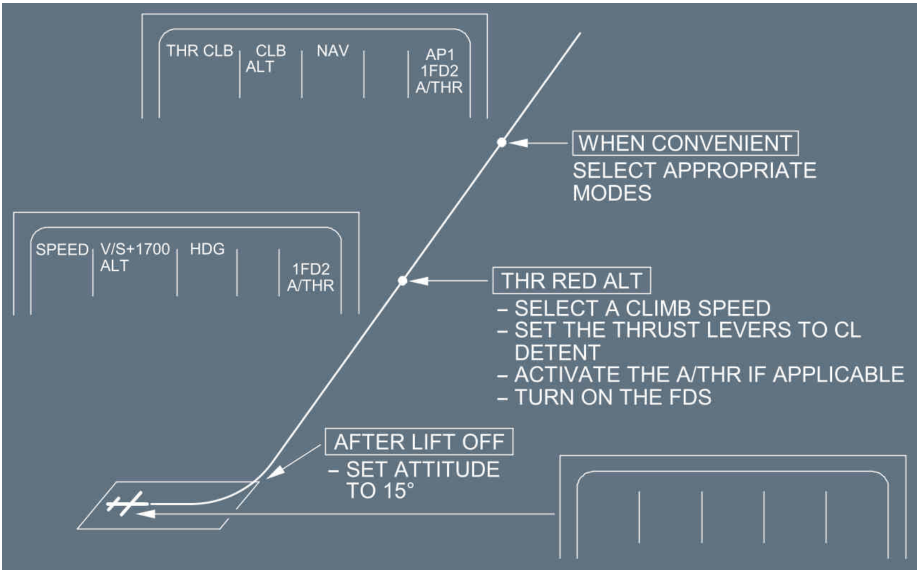
NO FLIGHT DIRECTOR TAKEOFF

Ident.: PRO-NOR-SRP-01-30-00002474.0002001 / 20 SEP 13
Applicable to: ALL

If a takeoff is initiated without FDs, the system responds as follow :

- There are no FD bars
- There is no autothrust arming
- There is no guidance available
- The target speed on the PFD is that selected on the FCU or is defaulted to 100 kt
- Setting the thrust levers to the CL detent does not activate autothrust.

Note: *Do not engage the autothrust prior to selecting a target speed on the FCU.*



THR CLB

A/THR
THR RED ALT
– SELECT A CLIMB SPEED
– SET THE THRUST LEVERS TO CL DETENT
– ACTIVATE THE A/THR IF APPLICABLE
– TURN ON THE FDS
AFTER LIFT OFF
– SET ATTITUDE TO 15°

PROCEDURE

Establish a pitch attitude of 15 ° in initial climb.

- **When reaching the thrust reduction altitude (THR RED ALT)**

  SELECT a climb speed

  SET the thrust levers to CL detent

  ACTIVATE the autothrust

  TURN ON the FDs (basic modes engage)

  SELECT appropriate mode.

  Failure of both FDs after the start of takeoff

  - *The FD bars disappear*
  - *The FCU window displays the target speed, which synchronizes on V2 or the current speed (if it is higher)*
  - *The autothrust remains armed*
  - *At thrust reduction altitude, LVR CLB flashes. If the pilot set the thrust levers to the CLB detent, the autothrust becomes active in selected SPD mode (no FDs selected). If the current speed is greater than the target speed, the thrust decreases*
  - *At acceleration altitude the target speed does not change, since it is selected.*

TAKEOFF WITH NO V2 ENTRY

Ident.: PRO-NOR-SRP-01-30-00002475.0001001 / 18 MAR 11
Applicable to: ALL

If V2 is not inserted the speed reference system (SRS) will not engage for takeoff. Five seconds after lift off V/S mode will engage. When V/S engages the current airspeed becomes the FCU target speed.

To regain a normal speed target, the pilot must :

SELECT the appropriate climb speed on FCU and PULL out the knob.

- **At ACC ALT :**

  PUSH the A/THR pusbutton on the FCU.

  SET the thrust levers to CL detent.

  PUSH in the SPD selector knob to get a managed speed target.

TAKEOFF USING THE LOCALIZER OF THE OPPOSITE RUNWAY

Ident.: PRO-NOR-SRP-01-30-00002476.0004001 / 09 OCT 12
Applicable to: ALL

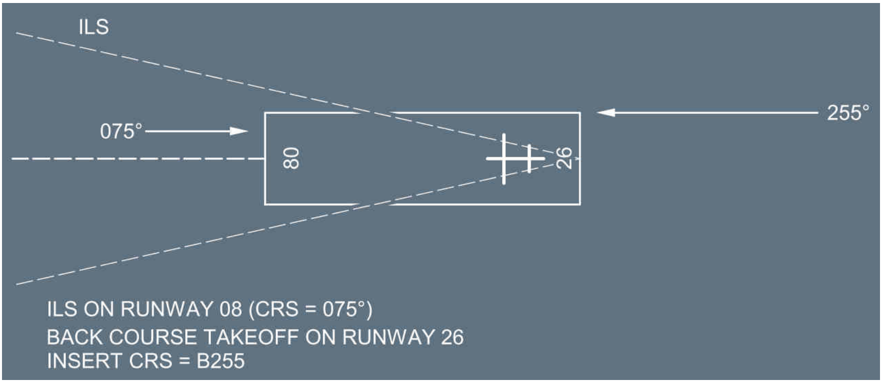
If the localizer, of the ILS associated with the opposite runway, must be used for takeoff :

SELECT the RAD NAV page.
ENTER the ILS IDENT.
If the ILS is in the database, the system tunes the proper frequency.
Check that the ILS front course is displayed in the CRS filed.

Note: *This may trigger the “RWY/ILS MISMATCH” message. Disregard it.*

- **If the ILS is not in the database :**

  INSERT the takeoff runway course with a "B".



ILS ON RUNWAY 08 (CRS = 075°)
BACK COURSE TAKEOFF ON RUNWAY 26
INSERT CRS = B255

DESELECT the LS pushbutton on ISIS.

Since ISIS displays the LOC reverse deviation.

SELECT ROSE ILS on one ND.

Intentionally left blank

Climb

MONITORING THE CLIMB PHASE

Ident.: PRO-NOR-SRP-01-40-00002477.0001001 / 23 DEC 14
Applicable to: ALL

The PF MCDU should display the PERF CLB page allowing him to monitor the climb.
The PM MCDU should display the F-PLN page to allow the flight crew to monitor time, speed and altitude predictions. This page also displays matched or missed information for constraints.

RECOMMENDATION

To ensure that you will not miss the next constraint, it is recommended to select the FCU altitude to the next constraint as described above.

MONITORING THE CONSTRAINTS

SPEED, ALTITUDE and TIME constraints can be checked using MCDUs. Each constraint is preceded by a star that indicates if the constraint is matched (magenta star) or missed (amber star).

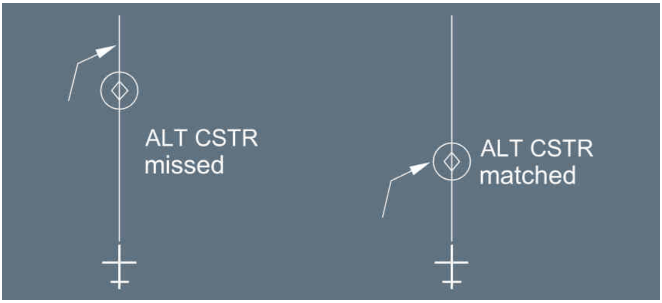
ALTITUDE CONSTRAINT

- **If an altitude constraint is predicted as missed,** use the following procedure :

  SET the FCU ALT to the next ALT CSTR

CHECK the position of the level off symbol on the ND (blue arrow) with respect to the waypoint with the constraint.

DECREASE the target speed until the constraint is met.



ALT CSTR missed
ALT CSTR matched

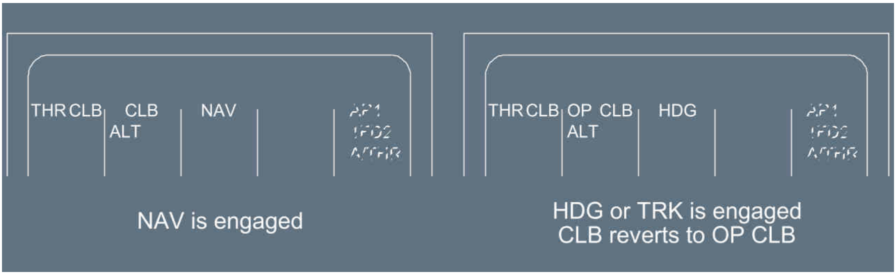
SPEED CONSTRAINT

CHECK the SPD CSTR predictions on the MCDU.

A magenta or amber star (*) indicates that the aircraft will match or miss the constraint.
If the aircraft is to miss the constraint by more than 10 kt, the MCDU scratchpad displays "SPD ERROR AT WPT ---- ".

HDG/TRK MODE ENGAGEMENT

If HDG/TRK is engaged, the guidance does not consider any F-PLN constraint. Therefore if the pilot disengages NAV, CLB mode reverts to OP CLB.



THR CLB

AP1
1FD2
A/THR
HDG or TRK is engaged
CLB reverts to OP CLB

SPEED SELECTION

- **If a specific speed is required :**

  TURN and PULL the SPD selector knob. (This changes the target speed to blue on the PFD speed scale).

Predictions on the F-PLN page assume that the speed remains selected until the next SPD LIM or SPD CSTR, or the next phase, whichever comes first.

IMMEDIATE RETURN TO ORIGIN AIRPORT

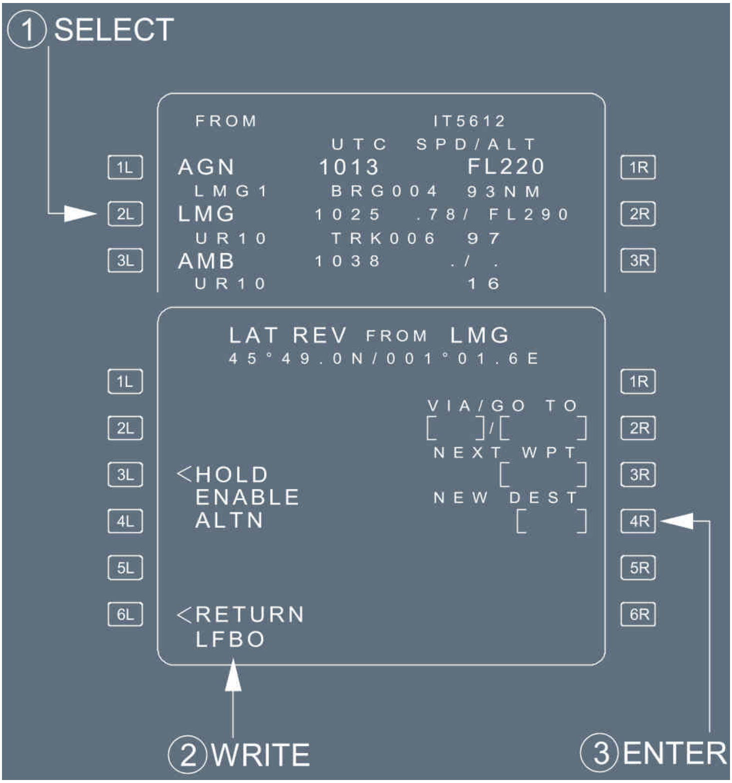
Ident.: PRO-NOR-SRP-01-40-00002478.0001001 / 16 NOV 11
Applicable to: ALL

- **If the SEC F-PLN has been prepared for an immediate return to the airport of origin:**

  ACTIVATE the SEC F-PLN.

  PERFORM a DIR TO the appropriate waypoint.

- **If the SEC F-PLN has not been prepared for an immediate return to the airport of origin:**



```

PERFORM a lateral revision at TO waypoint

ENTER the departure airport ident in the NEW DEST field and INSERT the temporary flight plan.

PERFORM a lateral revision at the new destination

SELECT : APPR – STAR – VIA – TRANS and INSERT

■ **When cleared to divert:**

PERFORM a DIR TO the suitable waypoint.

ENTER QNH, WIND, MDA/MDH, LDG CONF.

CHECK RAD NAV page.

Cruise

REACHING CRUISE FLIGHT LEVEL

Ident.: PRO-NOR-SRP-01-50-00002479.0001001 / 16 SEP 14
Applicable to: ALL

Upon reaching the cruise flight level, the pilot should be sure that the FMA displays “ALT CRZ” in its second column, which ensures that the aircraft is at CRZ FL (CRZ MACH, predictions valid, soft N1 (EPR) available).

- **If the FMA does not display ALT CRZ at the assigned FL (as may occur when the ATC-assigned FL is lower than the preplanned FL selected initially) :**

  PRESS the [PROG] key.

  ENTER the current cruise flight level.

  Note: *If the current cruise flight level is above the preplanned FL, selecting the FCU updates it automatically.*

- **If the pilot selected the speed target during the climb phase and planned to use ECON MACH for the cruise phase,** "SET MANAGED SPEED" or "CHECK SPEED MODE" appear on the PFD and MCDU as a reminder.

  PRESS the FCU speed selector knob to activate the managed Mach/speed.

MONITORING THE NAVIGATION ACCURACY

Applicable to: ALL

Ident.: PRO-NOR-SRP-01-50-A-00002480.0001001 / 21 MAR 17

GENERAL

On aircraft equipped with GPS PRIMARY, the navigation accuracy check is not required as long as GPS PRIMARY ◁ is available.
Otherwise, navigation accuracy shall be checked periodically in cruise.
The PROG page displays an estimated accuracy as being high or low (center of sixth line). “HIGH” means that the FMGES estimates the FM position accurate enough to meet the EN ROUTE criteria.
“LOW” means that the pilot must compare raw data from tuned navaids with corresponding data computed by FM and shown on the ND or MCDU PROG page. The appearance of the message “NAV ACCUR DOWNGRAD” on the MCDU calls for a similar crosscheck.

Note: *The pilot should make such a comparison periodically, even if the PROG page is displaying "HIGH" and navaids are available : this allows him to quantify the FM position error.*

The method for checking the accuracy is explained in the SOP (*Refer to DSC-22_20-20-20 Estimated Position Uncertainty*).
A quick check is explained here below when the TO waypoint is a DME type. (VOR/DME or DME or VOR/TAC or TAC).

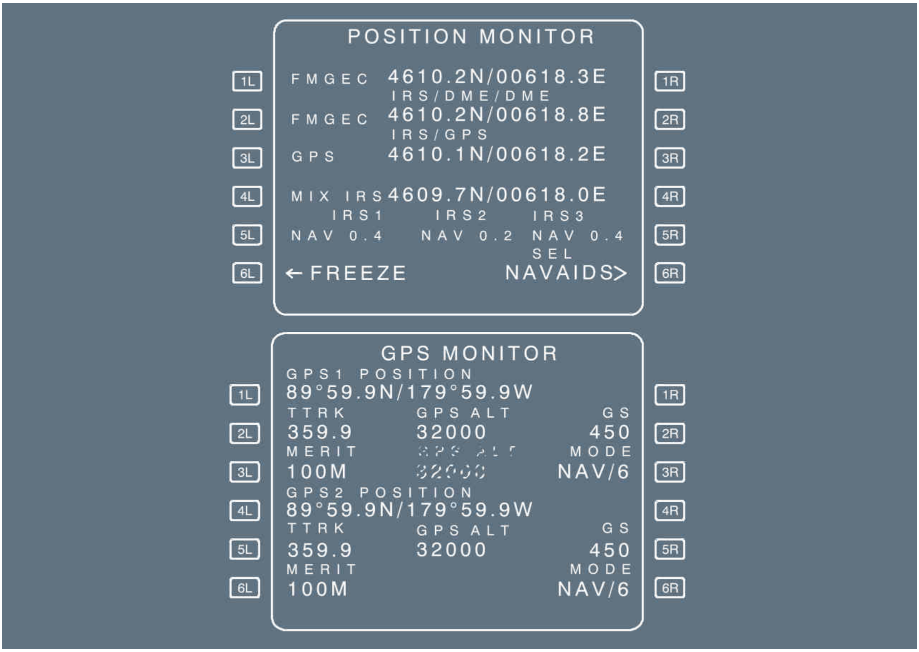
If the MCDU or the ECAM displays one of the following messages:
IRS ONLY NAVIGATION (10 min IRS NAV mode, en route) on the MCDU
FMS 1/2 POS DIFF (5 NM POS difference between FMs) on the MCDU
GPS PRIMARY LOST (FM-IRS threshold function of Δt) on the MCDU
CHECK IRS X/FM POS (FM-IRS threshold function of Δt) on the MCDU
FM/IRS POS DISAGREE (FM-IRS threshold function of Δt) on the ECAM
FM/GPS DISAGREE (> 0.5 NM)
NAV ACCUR DOWNGRAD (EPE > required RNP)
or, if there is a discrepancy between the raw data position and the FM position:

PRESS the [DATA] key on MCDU.
SELECT the POSITION MONITOR page.
SELECT "FREEZE".

On the other MCDU: Select the GPS MONITOR page.



```
          POSITION MONITOR

MONITORING THE FUEL PREDICTIONS

Ident.: PRO-NOR-SRP-01-50-00002482.0001001 / 09 OCT 12

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The F-PLN page and FUEL PRED pages display fuel and time predictions. These predictions are meaningful if the flight plan and the entered winds are accurate enough.

PROCEDURE

UPDATE the F-PLN to show accurate predictions.
Periodically CHECK the wind on the F-PLN B page, and update it when the current wind is significantly different.
Monitor the fuel by checking:

- *Estimated fuel on board (EFOB) at destination (F-PLN page)*
- *EFOB at alternate and extra fuel (FUEL PRED page)*

- **If the extra fuel is negative, modify successively the following data until the extra fuel becomes null or positive:**

  CHECK current cruise flight level versus the optimum level (OPT FL)

  If advisable, REQUEST reassignment to the OPT FL (or OPT FL +2 000)

  Decrease the cost index down to zero if necessary (MIN FUEL). If the extra fuel is positive, set CI = LRC.

  SELECT another ALTN on the ALTN page and CHECK whether or not XTRA FUEL becomes positive.

  Continue to check different alternates until you find one for which XTRA FUEL is null or positive.

- **When an alternate is not necessary, you may select “NO ALTN” option:**

  CHECK the required conditions (weather, runways, etc.) for NO ALTN.

  SELECT “NO ALTN” on the ALTN selection page.

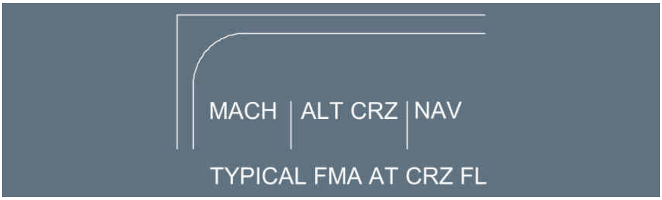
  ADJUST FINAL TIME on the FUEL PRED page.

  CHECK XTRA FUEL.

The pilot must ensure that the aircraft flies the cruise flight level entered on the PROG page. Then, the aircraft will:

- Fly at ECON CRZ MACH.
- Benefit from the A/THR SOFT mode.
- Present accurate predictions.

This is displayed on the Flight Mode Annunciator (FMA):



MONITORING THE FUEL PREDICTIONS

Ident.: PRO-NOR-SRP-01-50-00002482.0004001 / 01 OCT 12
Applicable to: LV-KHT, LV-KHU

The F-PLN page and FUEL PRED pages display fuel and time predictions throughout the flight. These predictions are meaningful if the lateral and vertical flight plan, and the entered winds are kept accurate enough as the flight progresses.

PROCEDURE

In addition to the Fuel Management procedure described in the SOPs (*Refer to PRO-NOR-SOP-15 Cruise - Flight Progress*), periodically apply the following actions :

KEEP ACCURATE FMS predictions

Periodically UPDATE the F-PLN elements (F-PLN waypoints, step altitudes, predicted winds).

CHECK the MIN DEST FOB value on the FUEL PRED page

The MIN DEST FOB value is computed by the FMS and by default it is equal to ALTN + FINAL. ALTN, FINAL and MIN DEST FOB can be modified by the flight crew. A the beginning of the CRZ phase, and/or after any change of destination or alternate airport, check that the MIN DEST FOB value is meaningful. Otherwise, update the MIN DEST FOB fuel value, as appropriate.

CHECK the DEST EFOB value on the F-PLN or FUEL PRED page.

MONITOR the EFOB at destination on the F-PLN or FUEL PRED page. If necessary, ADAPT the flight strategy.

"DEST EFOB BELOW MIN" MESSAGE

If the predicted EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page:
- The destination EFOB turns to amber on the F-PLN ad FUEL PRED page, PERF (CLB, CRZ, DES) pages, and REPORT page.
- The “DEST EFOB BELOW MIN” amber message is displayed on the MCDU scratchpad, after 2 min (if in CRZ or DES phase).

Note: *If the flight crew has cleared the “DEST EFOB BELOW MIN” message, and if the predicted EFOB at destination is still less than the MIN DEST FOB value, the “DEST EFOB BELOW MIN” message will appear again at the beginning of the descent phase.*

PROCEDURE

● **If the "DEST EFOB BELOW MIN" message is triggered on the MCDU:**

CHECK the DEST EFOB value on the F-PLN or FUEL PRED page,

CHECK the hypothesis used by the FMS to compute the fuel predictions,

Check that the F-PLN elements (F-PLN waypoints, step altitudes, predicted winds) are up-to-date, to ensure that the FMS predictions are accurate.
Check that the MIN DEST FOB fuel value is meaningful and corresponds to the planned fuel strategy.

ADAPT the flight strategy.

ENTERING A STEP CLIMB OR A STEP DESCENT

Ident.: PRO-NOR-SRP-01-50-00002483.0001001 / 03 NOV 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The flight crew may use the STEP ALTS page to enter up to four geographic step points or one optimal step (computed by the FMGES) at any waypoint of the cruise.

PROCEDURE

PRESS the PERF key.
SELECT the STEP ALTS prompt.

L2 *The PERF PAGE displays this prompt in cruise phase. The flight crew may also call up the STEP ALTS page using a vertical revision at any cruise waypoint.*

L1 ENTERING AN OPTIMAL STEP (ONLY STEP CLIMBS)

WRITE a step altitude, or FL in the scratchpad.
ENTER it in the [1R] field.
CHECK the FUEL and TIME SAVINGS, and predictions on the 5L and 5R fields.
INSERT it, if adequate.

L2 *After insertion, the optimum step climb is only updated when the flight crew presses the UPDATE prompt [6R].*
The ND shows symbols for the start of climb (S/C) and the top of climb (T/C). The MCDU shows the associated pseudo-waypoints.
It is possible to convert an optimum step to a geographic step by overwriting the [1L] field (see geographic step).

L1
- **When reaching the step climb pseudo-waypoint:**
  REQUEST climb clearance.
  ADJUST the FCU altitude to the STEP ALT, and PUSH.

ENTERING A GEOGRAPHIC STEP

WRITE a step altitude into the scratchpad.

L2 *The format is:*

- *Place/altitude (or FL)*
- *Place/distance/altitude (or FL).*

The place must be along the track.

L1 ENTER it in [1L] to [4L] field.

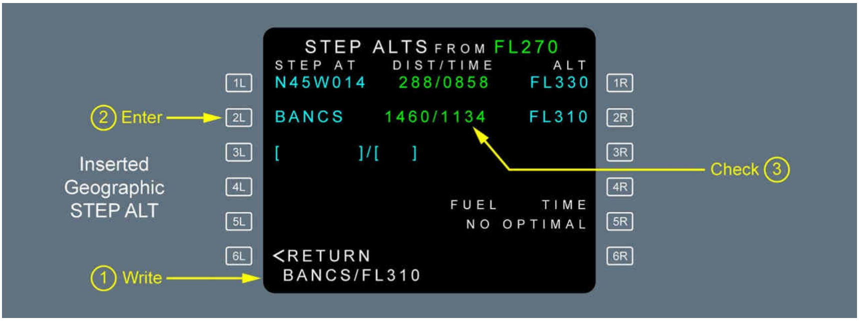
L2 *It is possible to independently modify either the location or the altitude of an existing step altitude. It is not possible to modify with a single entry both the location and the altitude:An entry “place/xxx” will be taken by the system as an along track offset of xxx nautical miles.*

L1 CHECK the predictions (distance, time).

- **When reaching the step climb or descent pseudo-waypoint:**

  REQUEST climb or descent clearance.

  ADJUST the FCU altitude to the STEP ALT, and PUSH.



```
STEP ALTS FROM FL270
STEP AT      DIST/TIME      ALT

<RETURN
 BANCS/FL310
```

② Enter

Inserted Geographic STEP ALT

① Write

Check ③

The DIST/TIME field may display the following messages:

- ABOVE MAX if the step altitude exceeds the MAX ALT
- IGNORED if the step end point is less than 50 NM from the top of descent
- STEP NOW when the aircraft is within 20 NM of the step point. If the aircraft overflies the step pseudo-waypoint without commencing a climb or a descent, the system deletes the step from the vertical F-PLN automatically (a “STEP DELETED” message is displayed on the MCDU scratchpad), and recomputes the predictions. The step is not deleted if the FCU altitude is moved only partially towards the step altitude. The flight phase remains “cruise” whenever a step is initiated.

Note: *For an altitude restriction defined at a waypoint less than 50 NM before the top of descent and lower than the CRZ FL, it is recommended to enter an altitude constraint rather than a step.*

ENTERING A STEP CLIMB OR A STEP DESCENT

Ident.: PRO-NOR-SRP-01-50-00002483.0004001 / 01 OCT 12
Applicable to: LV-KHT, LV-KHU

The crew may use the STEP ALTS page to enter up to four geographic step points or one optimal step (computed by the FMGES) at any waypoint of the cruise.

PROCEDURE

PRESS the PERF key.
SELECT the “STEP ALTS” prompt.

The PERF PAGE displays this prompt in cruise phase. The crew may also call up the STEP ALTS page using a vertical revision at any cruise waypoint.

ENTERING AN OPTIMAL STEP (ONLY STEP CLIMBS)

WRITE a step altitude, or FL in the scratchpad.
ENTER it in the [1R] field.

CHECK the FUEL and TIME SAVINGS, and predictions on the 5L and 5R fields
INSERT it, if adequate.

After insertion, the optimum step climb is only updated when the pilot presses the UPDATE prompt [6R].
The ND shows symbols for the start of climb (S/C) and the top of climb (T/C). The MCDU shows the associated pseudo-waypoints.
It is possible to convert an optimum step to a geographic step by overwriting the [1L] field (see geographic step).

- **When reaching the step climb pseudo-waypoint :**
  REQUEST climb clearance.
  ADJUST the FCU altitude to the STEP ALT, and PUSH.

1016NM/1035 -3.4 +022
OPT STEP
<RETURN INSERT*

ENTERING A GEOGRAPHIC STEP

WRITE a step altitude and waypoint into the scratchpad.

The format is:
- *Altitude (or FL)/waypoint (Ex: FL 350/BERAD)*
- *Altitude (or FL)/waypoint/distance (Ex: FL 350/BERAD/-20)*

The waypoint must be in the flight plan.

ENTER it in [1L] to [4L] field.

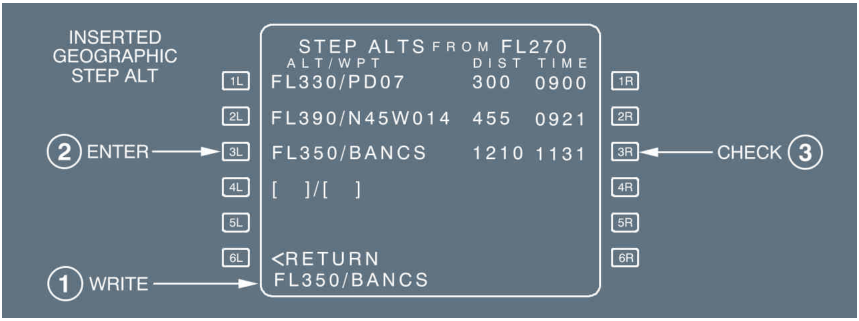
It is possible to independently modify either the location or the altitude of an existing step altitude. It is not possible to modify with a single entry both the location and the altitude : An entry "place/xxx" will be taken by the system as an along track offset of xxx nautical miles.

CHECK the predictions (distance, time).

- **When reaching the step climb or descent pseudo-waypoint :**

  REQUEST climb or descent clearance.

  ADJUST the FCU altitude to the STEP ALT, and PUSH the FCU knob.



```
   STEP ALTS FROM FL270
  ALT/WPT          DIST  TIME
FL330/PD07         300   0900

FL390/N45W014      455   0921

FL350/BANCS       1210   1131

[   ]/[   ]

<RETURN
FL350/BANCS
```

The DIST/TIME field may display the following messages:

- ABOVE MAX if the step altitude exceeds the MAX ALT.
- IGNORED if the step end point is less than 50 NM from the top of descent or if the step climb is located prior to the top of climb or after the top of descent.
- STEP AHEAD when the aircraft is within 20 NM of the step point. If the aircraft overflies the step pseudo-waypoint without commencing a climb or a descent, the system deletes the step from the vertical F-PLN automatically (a "STEP DELETED" message is displayed on the MCDU scratchpad), and recomputes the predictions. The step is not deleted if the FCU altitude is moved only partially towards the step altitude. The flight phase remains "cruise" whenever a step is initiated.

Note: *For an altitude restriction defined at a waypoint less than 50 NM before the top of descent and lower than the CRZ FL, it is recommended to enter an altitude constraint rather than a step.*

IMMEDIATE CHANGE OF LEVEL IN CRUISE

Ident.: PRO-NOR-SRP-01-50-00002484.0001001 / 15 FEB 11
Applicable to: ALL

- **When the pilot changes his flight level without inserting a step :**
  - **If the FCU-selected altitude is above the previous CRZ FL,** the CRZ FL on the PROG page changes to the new flight level.
  - **If the FCU-selected altitude is lower than the previous CRZ FL and if the distance to DEST is more than 200 NM, the CRZ FL on the PROG page changes.**

    In that case Mach target is managed as follows :
    - At the start of the descent, the Mach target is the managed Mach number at the initial cruise flight level.
    - When the aircraft reaches the new flight level, the Mach target switches either to the Mach number for the lower CRZ FL, or to the speed for the lower CRZ FL if the aircraft reaches the crossover altitude. This logic prevents the aircraft from exceeding VMO during descent.
  - **If the FCU-selected altitude is lower than the previous CRZ FL and the aircraft is within 200 NM of its destination, the system activates the descent phase .** The pilot may reactivate the cruise phase by entering a new cruise flight level in the PROG PAGE

PREPARATION FOR DESCENT AND APPROACH

Ident.: PRO-NOR-SRP-01-50-B-00002485.0001001 / 15 FEB 11
Applicable to: ALL

GENERAL

The preparation for descent and approach consists of :
- Entering PERF and WIND data
- Defining the lateral and vertical F-PLN
- Checking the tuning (auto or manual) of the appropriate NAVAIDs

After receiving the arrival information, the flight crew should use the following procedure.

Ident.: PRO-NOR-SRP-01-50-B-00002486.0001001 / 09 OCT 12
Applicable to: ALL

SELECTION

PERFORM a lateral revision at destination
SELECT ARRIVAL
SELECT an APPROACH, a STAR, a TRANSITION, a VIA.

When the flight crew selects successive items, the page are automatically sequenced. But pressing the [→] key brings up the APPR and STAR page successively.

CHECK the temporary revision including the missed approach.
INSERT the temporary revision, [6R] key.

Ident.: PRO-NOR-SRP-01-50-B-00002487.0001001 / 09 OCT 12
Applicable to: ALL

REVISION OF VERTICAL FLIGHT PLAN

CHECK the speed and altitude constraints as displayed on the ND. (Use the CSTR pb).
ENTER any additional speed or altitude constraints using the vertical revision page.

In order not to be too fast when commencing approach, you may insert a speed constraint at the FAF (Final Approach Fix).
When all computations are completed:

REVIEW the flight plan using the approach chart.

When the destination runway changes and if the previously selected STAR is compatible with the new runway, the system selects it automatically in the temporary F-PLN. If the flight crew has entered any revision or constraint on this STAR, it will not be transferred. The flight crew must reenter it in order to retain it for this approach.

PRESELECTING A MANAGED SPEED/MACH

As long as the descent phase is not active, the PERF DES page may either be used to select a speed, or a Mach number, or both, to replace the optimum descent speed.
The Flight Guidance Computer then uses the entered speed, instead of the optimum speed for computing the descent profile.
When the system switches to the descent phase, it sets the MANAGED target speed to the entered speed. From there, the speed may only be modified by using the FCU selector knob. Once in descent phase, the pilot cannot modify the MANAGED speed again.

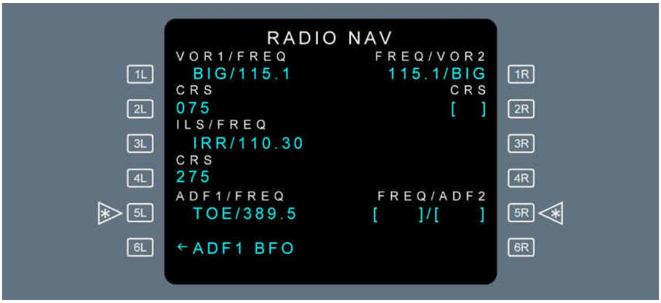
SELECTING THE RADIO NAVAIDS

CHECK, or SELECT, the appropriate NAVAIDS for the approach.

For an ILS / GLS ◁ / SLS ◁ procedure, the ILS / GLS ◁ / SLS ◁ will be autotuned.
NDBs must be entered manually.

Note: *When the destination has a VOR/DME, enter it manually in the VOR field. Enter its identifier in the BRG/DIST field of the PROG page. This allows you to perform a permanent NAV accuracy check.*



```

Intentionally left blank

Descent

DESCENT INITIATION

Ident.: PRO-NOR-SRP-01-60-00002494.0001001 / 16 NOV 11
Applicable to: ALL

The top of descent, displayed on the F-PLN page (T/D) and on the ND (↘), is a position that the system calculates, assuming that the aircraft will begin its descent in DES mode with managed speed, and that the system will guide the aircraft along the descent profile computed with all the vertical F-PLN data (ALT CSTR, MANAGED MACH/SPD, SPD CSTR, SPD LIMIT) to reach VAPP at 1 000 ft AGL.

Note: *The ND does not display the top of descent ↘ when HDG (or TRACK) mode is engaged.*

PROCEDURES

- **When the aircraft reaches the top of descent (T/D) :**

  SELECT the altitude target.

  PUSH the ALT selector knob. DES mode engages.

  CHECK the FMA annunciators.

DESCENT MONITORING

Applicable to: ALL

Ident.: PRO-NOR-SRP-01-60-A-00002495.0002001 / 04 JUN 19

DES MODE ENGAGED

When DES mode is engaged, NAV mode is engaged, and the system takes into account all altitude and speed constraints of the F-PLN.
The key parameter for monitoring the descent is the vertical deviation (VDEV) displayed on the PFD and on the PROG page, which indicates whether the aircraft is on, above, or below the descent profile.

PROCEDURE

SET the ATC cleared altitude on the FCU (considering also what is the safe altitude).

If the lowest safe altitude is higher than the ATC-cleared altitude, check with ATC that this constraint applies.
If it is confirmed, SET the FCU altitude to the safe altitude until it is safe to go to the ATC-cleared altitude.

MONITOR the vertical deviation (VDEV) on the PFD and the PROG page.

MONITOR the speed change that occurs when the aircraft reaches a speed change symbol (magenta ball) under managed speed.
MONITOR the (ALT*, ALT CST*, ALT, ALT CST) when the aircraft reaches level symbols.

- **If the aircraft is on the descent profile:**
  The aircraft is considered to be on the vertical profile when it is within 50 ft of it. VDEV is close to zero, and the system predicts that it will match constraints until the aircraft levels off at the next FCU altitude.

  MONITOR the predicted descent point after the next level-off.

  The autothrust adjusts the thrust for the particular segment. The first FMA column may display THR IDLE or SPEED.

STD

- **If the aircraft is above the descent profile:**

  VDEV is down on the PFD and positive on the PROG page.

  The autothrust sets IDLE thrust and the AP increases speed by calling for down elevator. If the aircraft reaches the upper limit of the managed speed range, the aircraft diverges and maintains the upper limit speed.

ECON DES
CRZ OPT REC MAX
----- ----- FL390
VDEV= + 2540FT

PROCEDURE

SELECT a descent speed higher than the upper limit when possible.

MONITOR the intercept symbol ↝.

When this symbol reaches the next ALT CSTR waypoint EXTEND SPD BRK appears on the PFD indicating that speedbrakes must be extended in order to match the next altitude constraint. This is an advisory message.

Note: *When DES mode is engaged, the speedbrake extension will not necessarily increase the descent rate. It does so only if the aircraft is above the profile. If the aircraft is on or below the profile: the system will add thrust to keep the aircraft on profile and within the speed target range.*

Note: *With DPO ⊲ , when above the descent profile, the flight crew may have to extend the speed brakes in order to go back on the descent profile.*

Altitude Error at CLIFF

- **If a speed constraint is predicted to be missed:**
  SELECT an appropriate speed.
  RESUME managed speed when the aircraft is back on the descent path.
- **If the aircraft is below the descent profile:**
  VDEV is up on the PFD and negative on the PROG page. The system maintains the target speed (managed or selected speed).

  MONITOR the intercept symbol ([↝]) on the ND, and any leveling off at the next ALT CSTR.

- **If the aircraft is flying at an altitude that is higher than both the descent speed limit altitude and the destination elevation +5 000 ft:**

  The FMGES maintains the V/S at -1 000 ft/min and the target speed, until the aircraft reaches the altitude constraint, or intercepts the descent profile.

- **If the aircraft is flying at an altitude that is lower than either the descent speed limit altitude, or the destination elevation +5 000 ft:**

  The FMGES maintains the V/S at -500 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

OP DES, V/S OR FPA MODE ENGAGED

- In either case, the aircraft is no longer guided on the descent profile and altitude constraints are disregarded. If NAV mode is engaged the ND displays a white circle on waypoints with an altitude constraint. If NAV mode is disengaged, the circles are removed.
- The PFD still shows VDEV for reference purposes.
- The target altitude is always the FCU selected altitude (shown in blue).
  On the ND, level-off symbol is blue (no constraint). If NAV mode is engaged and the speed target managed, speed constraints are taken into account.

Vertical position may also be accessed by using the energy circle displayed on the navigation display when HDG/TRK is engaged.

PROCEDURE

SET the FCU altitude as cleared by ATC, while also considering the applicable safe altitude.

If the next safe altitude is higher than the ATC-cleared altitude, check with ATC that this constraint applies.
If confirmed, set the FCU altitude at the safe altitude until it is safe to fly at the cleared altitude.

MONITOR the speed target when the aircraft reaches the speed change symbol.
MONITOR the FMA ALT*, ALT, upon reaching the level symbol.
MONITOR the energy circle on the ND when in HDG/TRK mode.

The MCDU F-PLN page presents SPD/ALT constraint-matching predictions, which assume that DES mode is reengaged immediately.

CHECK the predictions before reengaging DES mode (in order to resume the descent profile).

Note: *VDEV is available on the PFD even in HDG mode ; it is a valuable tool for monitoring the descent as long as cross-track error (XTK) is less than five nautical miles*
The aircraft decelerates for approach automatically only if it flies over the DECEL pseudo waypoint with NAV mode engaged (or LOC, LOC).*

MONITORING THE NAVIGATION IN THE TERMINAL CONTROL AREA

Ident.: PRO-NOR-SRP-01-60-00002497.0001001 / 07 FEB 11
Applicable to: ALL

If the MCDU “SYSTEM (AREA) (PROCEDURE) RNP IS XX.X” message is displayed, the crew will verify the manually-entered RNP value in the REQUIRED field of the PROG page and clear or modify it, if it is not in accordance with the RNP value specified in the area (Nav or approach chart).

TOO STEEP PATH

Ident.: PRO-NOR-SRP-01-60-00002498.0001001 / 07 FEB 11
Applicable to: ALL

“TOO STEEP PATH AHEAD” appears on the MCDU scratchpad, when the system predicts this situation, and TOO STEEP PATH is displayed on the F-PLN page.
When the aircraft is crossing the first waypoint of a TOO STEEP PATH, the system computes a flyable descent profile (with an idle segment). The VDEV makes a jump because it is related to a new profile.

F.PLN A PAGE WITH A TOO STEEP PATH

PROCEDURE :

- **When passing the first waypoint of the TOO STEEP PATH :**
  MONITOR VDEV and predictions at the next CSTR waypoint.
  If required, EXTEND the speedbrakes before seeing the “EXTEND SPD BRK” message.
  CONSIDER using a holding pattern, if necessary.

HOLDING PATTERN

Ident.: PRO-NOR-SRP-01-60-00002499.0001001 / 09 OCT 12
Applicable to: ALL

A hold may be required during the descent and manually inserted.

PROCEDURE

PRESS the F-PLN key.
SELECT the lateral revision page.
SELECT the HOLD prompt.
CHECK the HOLDING data, and MODIFY it if necessary.
CHECK the temporary flight plan and INSERT the holding pattern in it.

Note: *If the holding fix is close to the DECEL pseudo waypoint and the speed is managed, manually activate the approach phase to change the managed target speed to approach speed (VAPP). This will avoid having an inappropriate increase of speed.*

PROCEDURE

- **If ATC requires a specific speed:**

  SWITCH to selected speed (turn and pull the speed selector knob on the FCU).

  ADJUST the aircraft configuration accordingly.

- **If ATC orders successive step descents down to the final approach flight path:**

  Use the V/S or FPA mode.

  MONITOR V/DEV.

NAV ACCURACY

As required by the SOP.
(*Refer to PRO-NOR-SOP 18 Aircraft Guidance Management*).
Without GPS, and when no DME is available for the accuracy check, use HIGH/LOW on the PROG page. In this case, consider a "HIGH" to be equivalent to a positive crosscheck.

ATC CLEARANCE

MODIFY the F-PLN, RAD NAV, and PERF APPR data to agree with the latest clearance and landing information.

APPROACH WITH ILS/GLS (IF INSTALLED)/SLS (IF INSTALLED)

Ident.: PRO-NOR-SRP-01-70-A-00002507.0001001 / 15 NOV 21
Applicable to: ALL

INTERMEDIATE/FINAL APPROACH (ILS / GLS ◁ / LPV (WITH SLS ◁) APPROACH ENTERED IN THE F-PLN)

The preferred technique for flying an ILS / GLS ◁ / LPV (with SLS ◁) approach is to fly a decelerated approach using the AP/FDs, the LOC and G/S modes, autothrust in the SPEED mode, managed speed target is recommended.

DECELERATED APPROACH

The decelerated approach technique brings the aircraft down to 1 000 ft, at VAPP. In most cases, the interception of the final descent path is achieved with CONF 1 at S speed.

APPROACH MODE ACTIVATION (LOC - G/S)

- **When cleared by ATC and when appropriate:**

  PRESS the APPR pb on the FCU to arm the APPR mode for the approach entered in the flight plan.

  Note: *If a non ILS/GLS ◁ approach is selected in the active flight plan and if the pilot manually tunes an ILS/GLS ◁ on the RADIO NAV page:*
  - The MCDU and PFD display CHECK APPR SELECTION. This message is a reminder to the pilot that this manually-tuned landing system does not correspond to the approach that is selected in the flight plan.
  - When the APPR pb is pressed in on the FCU, the available approach guidance modes are LOC and G/S.

  The FCU APPR pb arms or engages LOC and G/S modes, if :
  - An ILS/GLS ◁ /LPV (with SLS ◁) approach is entered in the flight plan, or
  - An ILS/GLS ◁ is manually-tuned on the RADIO NAV page, or
  - Both RMPs are set to NAV, and an ILS/GLS ◁ is selected.

Ident.: PRO-NOR-SRP-01-70-A-00002508.0001001 / 21 MAR 16
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

APPROACH MODE ACTIVATION (LOC - G/S)

- **When cleared by ATC and when appropriate:**

  PRESS the APPR pb to arm the APPR mode for the approach entered in the flight plan.

  Note: *If a non precision approach is selected in the active flight plan and if the pilot manually tunes an ILS/GLS on the RAD NAV page, the MCDU and PFD display "CHECK APPR SELECTION". This message is a reminder to the pilot that, although an ILS/GLS is tuned on RAD NAV page, the available approach guidance modes are APP NAV - FINAL when the APPR pb is pressed in on the FCU.*

  The FCU APPR pb arms or engages LOC and G/S modes, if :
  - An ILS/GLS approach is entered in the flight plan, or
  - No approach, or only a runway, is entered in the flight plan, and an ILS/GLS is manually-tuned on the RAD NAV page, or
  - Both RMPs are set to NAV, and an ILS/GLS is selected.

Ident.: PRO-NOR-SRP-01-70-A-00002509.0001001 / 12 MAY 22
Applicable to: ALL

AUTOLAND

CHECK that the FMA displays the aircraft capability for the intended ILS/GLS approach (CAT 2 or CAT 3 for ILS, AUTOLAND for GLS).
MONITOR the radio automatic callout.

- **At 350 ft RA:**

  CHECK that LAND is displayed on the FMA.

  CHECK ILS/GLS course.

  Note: *If LAND is not displayed or if the ILS/GLS course is not correct, do not perform an autoland. The flight crew should perform a go-around, if visual references are not sufficient.*

- **At 40 ft RA:**

  CHECK that FLARE is displayed on the FMA.

- **At approximately 30 ft RA:**

  CHECK that IDLE is displayed on the FMA and that autothrust starts to reduce thrust toward IDLE.

- **At 10 ft, “RETARD” callout comes up:**

  MOVE the thrust levers to IDLE.

  L2 *Autothrust disconnects.*

L1
- **At touchdown:**

  CHECK that ROLL OUT appears on the FMA.

- **At the end of the rollout:**

  Disconnect the autopilot.

  L2 *If the flight crew does not disconnect the AP at the end of the rollout, and uses the nosewheel steering handwheel to taxi the aircraft off the runway, the following will occur:*
  - *The AP will try to steer the aircraft back to the runway centerline, if the nosewheel steering handwheel is released and the aircraft heading is less than 20 ° off the runway centerline*
  - *The AP will automatically disconnect, if the aircraft heading is 20 ° or more off the runway centerline.*

Ident.: PRO-NOR-SRP-01-70-A-00002510.0001001 / 21 NOV 11
Applicable to: ALL

MANUAL LANDING

- **at DH**

  DISCONNECT the autopilots. SPEED mode remains engaged.

- **At 20 ft “RETARD” automatic call out comes up**

  MOVE the thrust levers to IDLE if they are not there already. (The autothrust disconnects).

- **At touch down**

  “ROLL OUT” appears on the FMA and the yaw bar comes up on the PFD.

  Note: *The retard call out is only a reminder when a manual landing is performed.*

EARLY SELECTION OF APPROACH MODE LOC - G/S

Pressing the APPR pb arms LOC and G/S.
When the aircraft is above 5 000 ft AGL, the Radio altimeter signals may not be valid. As long as the Radio altimeter signals are invalid, the FMA displays CAT 1.

- **When the aircraft is cleared for an ILS/GLS ◁ approach:**
  PRESS the APPR pb on the FCU.
- **When the aircraft is below 5 000 ft AGL:**
  Check that the FMA displays the correct capability for the intended approach.

Ident.: PRO-NOR-SRP-01-70-A-00002513.0001001 / 20 NOV 14
Applicable to: ALL

GLIDE SLOPE INTERCEPTION FROM ABOVE

If the aircraft is above the glide slope, the system will not capture the G/S automatically.
The pilot must bring the aircraft onto the glide slope beam, and selects an appropriate V/S to intercept it. Refer to the Section PRO NOR SOP.

Ident.: PRO-NOR-SRP-01-70-A-00002514.0001001 / 15 NOV 21
Applicable to: ALL

DATA LOCK

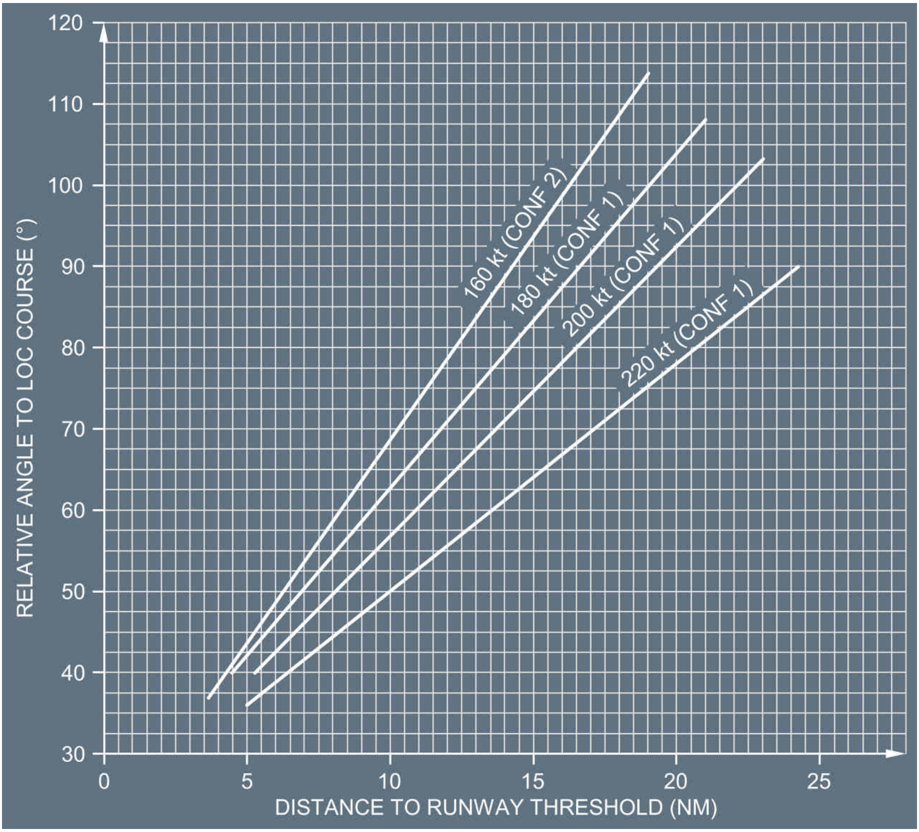
When the aircraft reaches 700 ft RA with APPR mode (LOC and G/S) armed or engaged, the ILS /GLS ◁ / SLS ◁ frequency/channel and course are frozen in the receiver.
This function (LS tune inhibit) is available when at least one AP/FD is engaged. Any attempt to change ILS / GLS ◁ frequency or CRS through the MCDU or RMP does not affect the receiver. In the same way SLS ◁ de-selection is not available.
If the speed is managed, the system does not accept any modifications the flight crew may enter on the PERF APPR page (surface wind, selected landing configuration, or VAPP) for speed guidance purposes below this altitude.
When the aircraft reaches 400 ft RA, LAND mode engages. The flight crew can disengage this mode only by engaging the GO AROUND mode.

Ident.: PRO-NOR-SRP-01-70-A-00002515.0001001 / 12 FEB 13
Applicable to: ALL

USE OF RMPS FOR ILS/DME OR GLS ◁

If both FMGECs fail, the flight crew can use the RMPs (Radio Management Panels 1 and 2) for back up tuning. Either RMP controls ILS/GLS ◁ . Prior to select an ILS frequency or a GLS ◁ channel on one of the RMPs, the flight crew has to select NAV pb-sw from RMP1 and RMP2.

The flight crew must always monitor the capture of a LOC beam. During this evolution, the PFD and ND must indicate that associated deviation indications move toward the centre of the scale. To avoid performing a false capture, the flight crew must be careful not to arm the LOC too early.
The following graph shows the angle of interception versus distance to the runway threshold that ensures that the aircraft will not overshoot the axis by more than one and a half dot.



The capture begins when the deviation is two dots or less. It is programmed to line the aircraft up on the beam with a single overshoot, even if the intercept angle is large.

Note: *ICAO requires loc beam to ensure a normal capture within 10 NM and +/- 35 ° of the course centerline. Some current ILS/GLS systems just meet the requirement and are subject to false capture outside these limits.*

SWITCHING FROM NON PRECISION TO ILS/GLS APPROACH

Ident.: PRO-NOR-SRP-01-70-00002517.0001001 / 03 NOV 21
Applicable to: ALL

If an ILS/GLS approach is possible when a non precision was previously scheduled, use one of the following procedures :

USE OF SECOND FLIGHT PLAN

Use a secondary flight plan to prepare the alternate ILS/GLS approach, time permitting.

COPY the ACTIVE flight plan.
REVISE the ARRIVAL : insert the ILS/GLS approach and the applicable STAR/VIA.
On the RAD NAV page, TUNE in the ILS/GLS manually.
REVISE the PERF APPR page.

CHANGE OF THE CLEARANCE

ATC changes the clearance from the non precision to the ILS/GLS approach.

- **If a secondary flight plan has been prepared :**

  ACTIVATE the SEC F-PLN and adjust.

  Follow subsequent standard procedures.

- **If a secondary flight plan has not been prepared :**

  REVISE the ARRIVAL on the primary F-PLN, inserting the ILS/GLS approach.

  REVISE the PERF APPR page.

  Follow subsequent standard procedures.

CAUTION If the flight crew decides to fly the ILS/GLS approach without revising the arrival of the primary flight plan (a non precision approach is in the F-PLN), LOC and G/S modes will not be available when the flight crew presses the APPR pb.

Consequently, the flight crew should:
- Manually TUNE in the ILS/GLS on the RAD NAV page : CHECK that the CHECK APPR SELECTION message comes up.
- Press the LS pushbutton and select ROSE LS on the EIS CONTROL panel.
- Use HDG, V/S or TRK, FPA modes to fly the ILS/GLS .

LANDING CATEGORIES

Ident.: PRO-NOR-SRP-01-70-00002523.0001001 / 12 FEB 13
Applicable to: ALL

Each FMGEC computes its own landing category:
- For ILS: CAT 1, CAT 2, CAT 3 single, and CAT 3 dual
- For GLS : CAT 1 AUTOLAND.

Each FMGEC then displays the corresponding landing category on the FMA.
Each category depends upon the availability of aircraft systems and functions.
When the landing category downgrades, a triple clic aural warning is activated.

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic system allows the aircraft to complete the approach, flare, and landing. A CAT 3 DUAL system is a fail-operational automatic landing system.

Note: *In the event of a failure, the automatic landing system operates as a fail-passive system.*

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition or deviation of flight path or attitude, but the landing is not completed automatically. A CAT 3 single system is a fail-passive automatic landing system.

Note: *With a fail-passive automatic landing system the pilot assumes control of the aircraft after a failure.*

Below 200 ft (radio altimeter), the FMGES freezes the landing capability until LAND mode is disengaged or both autopilots are off.
Therefore a failure occuring below 200 ft does not change the category of the system.

ALERT HEIGHT

The alert height is the height above touch down, above which a CAT 3 autoland would be discontinued and a missed approach executed, if a failure occured in either the airplane systems or the relevant ground equipments.
Below the alert height, if such a failure occurs, the flare, touchdown and roll out may be accomplished using the remaining automatic system.

WARNINGS FOR ILS/GLS ◁ APPROACH

Ident.: PRO-NOR-SRP-01-70-00002524.0004001 / 26 NOV 19
Applicable to: ALL

AUTOLAND WARNING

With “LAND” or “FLARE” on the FMA and at least one AP engaged, the AUTOLAND light appears on the glareshield when the aircraft is below 200 ft RA and one of the following event occurs:
- The autopilots are lost
- The aircraft gets too far from the beam (LOC and G/S flash on PFD)
- Loss of LOC signal above 15 ft, or loss of glide signal above 100 ft (transmitter or receivers)
- The difference between both radio altimeter indications is greater than 15 ft
- The FMGES detects a long flare
- The FMGES detects a too-early flare.

WARNING OF EXCESSIVE BEAM DEVIATION

This warning is a flashing of the LOC and G/S scales on the PFD and ND ROSE if one of the following event occurs:
- G/S deviation is greater than 1 dot (above 100 ft RA)
- LOC deviation is greater than ¼ dot (above 15 ft RA).

WARNING ASSOCIATED WITH ILS "LANDING CAPABILITY"

Any downgrading in the aircraft’s capability for automatic approach and landing sounds a triple-click aural warning.

FAILURE OF BOTH LOCALIZER AND GLIDESLOPE RECEIVERS

The PFD and ND (rose mode) display LOC and G/S flags (if the LS pb has been pressed). LOC and G/S scales disappear from the PFD.

If LOC or G/S modes are engaged and at least one AP/FD is engaged all of the following occur:
- The AP disengages
- The FD reverts to its HDG-V/S or TRK-FPA mode.

FAILURE OF LOCALIZER OR GLIDESLOPE TRANSMITTER (WHEN CAPTURED)

If the Localizer or Glideslope transmitter fails all of the following occur:
- The corresponding index is lost
- The LOC and G/S scales flash
- The corresponding FD bars flash.

Above 200 ft RA, if the transmitter failure lasts less than 7 s, the FMA retains the LOC and G/S modes (or the LAND mode) and the AP are able to regain these modes. If the failure lasts longer than 7 s, the AP disengages and the FD reverts to its HDG-V/S or TRK-FPA mode. Below 200 ft RA, if the transmitter failure occurs, the AUTOLAND warning appears, indicating that the crew must perform a GO AROUND (if insufficient visual references) with one or 2 AP engaged.

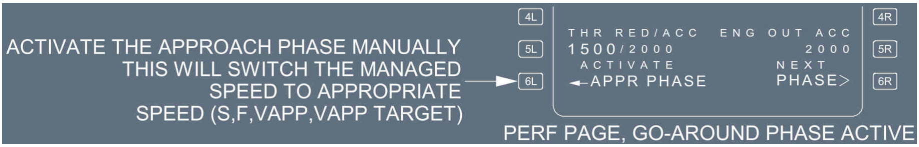
Go-Around

MONITORING THE GO-AROUND

Ident.: PRO-NOR-SRP-01-80-00002501.0001001 / 15 FEB 11
Applicable to: ALL

Engage the GO-AROUND phase and GO-AROUND modes by setting the thrust levers to the TOGA position, if at least CONF1 is selected.
When the GO-AROUND phase is engaged, the previously-flown approach is automatically strung back into the flight plan at the end of the missed approach procedure.
In the GO-AROUND phase, the system makes no predictions. Consequently, CLB and DES modes are not available, and the flight crew must monitor constraints.
When the aircraft leaves the GO-AROUND phase, all predictions and modes become available again. During a GO-AROUND phase, the managed speed is green dot.

CAUTION	If ALT* engages, as the aircraft emerges from SRS mode, and an engine-out occurs more or less simultaneously, the aircraft may lose airspeed as it tries to capture altitude.



ACTIVATE THE APPROACH PHASE MANUALLY THIS WILL SWITCH THE MANAGED SPEED TO APPROPRIATE SPEED (S,F,VAPP,VAPP TARGET)

PERF PAGE, GO-AROUND PHASE ACTIVE

HEADING/TRACK PRESET FUNCTION IN GO-AROUND PHASE

The flight crew can use the heading/track preset, when LOC*, LOC, LAND, FINAL, or GA is engaged.

SET the appropriate heading, or track value, in the window of the FCU.
When necessary, PULL the HDG/TRK selection knob to engage the mode on the preset value.

MISSED APPROACH : TRY AGAIN

Ident.: PRO-NOR-SRP-01-80-00002505.0001001 / 16 NOV 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

If the flight crew intends to fly another approach to the destination
- The flight plan has all the data necessary for the missed approach.
- Green Dot is the target speed.

● **When cleared by ATC to follow the missed approach procedure**
ENGAGE NAV mode or
TURN and PULL the HDG knob to set a heading

HDG or TRK or NAV modes can be engaged only above 100 ft.

● **When entering the initial approach area**

Activate the approach phase on the MCDU PERF GO AROUND page.

● **If the APPR phase is not activated :**

- Managed approach speed will not be available.
- The system will not furnish predictions.
- MDA/MDH/DH warnings will not appear on the PFD.

MISSED APPROACH: TRY AGAIN

Ident.: PRO-NOR-SRP-01-80-00002505.0003001 / 16 NOV 11
Applicable to: LV-KHT, LV-KHU

If the flight crew intends to fly another approach to the destination
- The flight plan has all the data necessary for the missed approach.
- Green Dot is the target speed.

● **When cleared by ATC to follow the missed approach procedure**
ENGAGE NAV mode or
TURN and PULL the HDG knob to set a heading

HDG or TRK or NAV modes can be engaged only above 100 ft.

● **When entering the initial approach area**

Activate the approach phase on the MCDU PERF GO AROUND page.

● **If the APPR phase is not activated :**

- Managed approach speed will not be available.
- The system will not furnish predictions.
- BARO/RADIO warnings will not appear on the PFD.

MISSED APPROACH: DIVERT

Ident.: PRO-NOR-SRP-01-80-00002503.0001001 / 17 MAR 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

- **If the flight crew decides to divert to the alternate:**
  ENABLE ALTN, preferably at the TO waypoint.
- **When cleared to a waypoint:**
  PERFORM a DIRECT TO.

The system reverts automatically to CLB phase and modifies the target speed from Green Dot to initial speed.
The system automatically sets the CRZ FL at the defaulted alternate CRZ FL (FL 220 or 310), and retains the previous cost index.
The flight crew may adjust these as necessary.

Note: *Diversion may also be initiated by entering a NEW DEST in the LAT REV page at the TO Waypoint or using the secondary F-PLN if prepared. Refer to Diversion Chapter (Refer to DSC-22_20-60-110 Equitime Point).*

MISSED APPROACH: DIVERT

Ident.: PRO-NOR-SRP-01-80-00002503.0002001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

- **If the flight crew decides to divert to the alternate:**
  ENABLE ALTN, preferably at the TO waypoint.
- **When cleared to a waypoint:**
  Perform a DIRECT TO.

The system reverts automatically to CLB phase and modifies the target speed from Green Dot to initial speed.
The system automatically sets the CRZ FL to the defaulted alternate CRZ.
The cost index is set to 0.0 and the message USING COST INDEX-000 is triggered.
The flight crew may adjust these as necessary.

Note: *Diversion may also be initiated by entering a NEW DEST in the LAT REV page at the TO waypoint or using the secondary F-PLN if prepared (Refer to DSC-22_20-60-110 Equitime Point).*

ETOPS CRITICAL FUEL RESERVES

Ident.: PRO-SPO-40A-00023706.0001001 / 03 NOV 21
Applicable to: ALL

ICING

The most critical scenario must be compensated for the greater of:

A. The effect of airframe icing during 10 % of the time during which icing is forecast, including ice accumulation on unprotected surfaces, and the fuel used by engine and wing anti-ice during this period.

B. Fuel for engine and wing anti-ice for the entire time during which icing is forecast.

Note: *The ETOPS icing fuel reserve is always limited by (B).*

Unless a reliable icing forecast is available, icing may be presumed to occur when the Total Air Temperature is less than +10 °C (50 °F), or if the outside air temperature is between 0 °C (32 °F) and -20 °C (-4 °F) with a relative humidity of 55 % or more.

APU

Fuel consumption of 130 kg/h or 287 lb/h (APU GEN ON, APU BLEED OFF).
In view of our experience, Airbus recommends that the operator includes a contingency fuel provision from departure to the Critical Point, when computing the ETOPS critical fuel planning.

DIVERSION DECISION MAKING

Ident.: PRO-SPO-40A-00023707.0001001 / 03 NOV 22
Applicable to: ALL

The technical criteria governing a re-routing or diversion decision can be classified into five categories, as follows:

- Loss of NAT-HLA capability, before entering the NAT-HLA area (as applicable)
- Weather minima at diversion airport(s) going below the company/crew en-route minima, before reaching the ETOPS Entry Point, or diversion airport(s) becoming unsuitable for any reason
- Failure cases requiring a diversion to the nearest airport (cases leading to a LAND ASAP message on the ECAM and/or in the QRH)
- Failure cases resulting in increased fuel consumption, exceeding the available fuel reserves
- Electrical generation.
  Diversion is required in the case of:
  - Only one generator (either one IDG, APU GEN or EMER GEN) remaining available following a multiple failure, or
  - Only one main generator (either one IDG or APU GEN) remaining available, and low level, low pressure or overheat on the green hydraulic circuit.

Comments and recommendations

- Fuel system
  Some failure cases may lead to fuel gravity feeding which implies flight at lower altitude or to some fuel being unusable. The flight crew's evaluation of the actual situation and the fuel remaining may lead to the decision that a diversion is required.

ABNORMAL AND EMERGENCY PROCEDURES

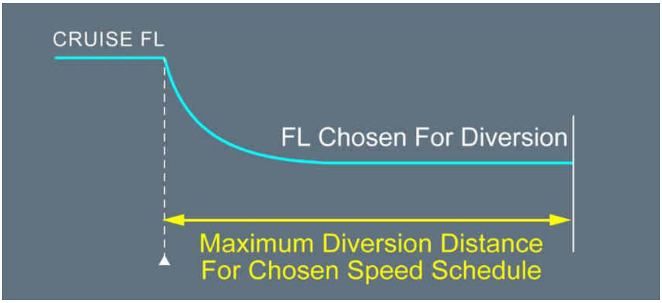
Ident.: PRO-SPO-40A-00023708.0001001 / 17 NOV 20
Applicable to: ALL

The procedures given in the EASA approved Airbus ETOPS CMP document are applicable.
The SOP (refer to chapters PRO, NOR, SOP) and the ABNORMAL and EMERGENCY procedures (refer to chapters PRO, ABN) apply. For ETOPS flights, the following additional procedure apply:
GEN 1 or 2 FAULT

● **When in ETOPS segment :**
APU GEN (if available)...USE

MAXIMUM DIVERSION DISTANCE

Ident.: PRO-SPO-40A-00023709.0018001 / 17 NOV 20
Applicable to: LV-KHT, LV-KHU



The following computation takes into account the below conditions:

- ISA conditions
- No wind
- Optimum diversion level after engine failure
- Single engine diversion speed schedule.

Note: *Obstacles have not to be considered to determine if a route is or is not an ETOPS route.*

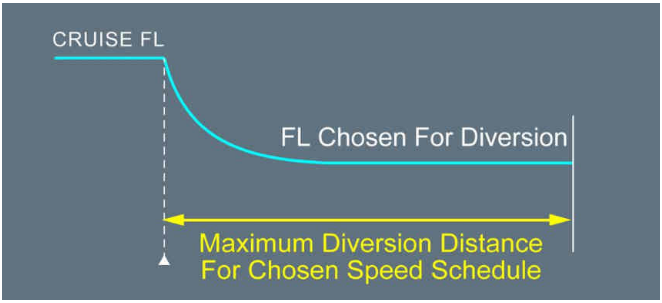
	230000	190	401	592	783	1164	1546

(1) *The distance is limited by the maximum diversion distance as per AFM. For more information, Refer to AFM/APP/ETOPS/Limitations.*

MAXIMUM DIVERSION DISTANCE

Ident.: PRO-SPO-40A-00023709.0016001 / 17 NOV 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO



The following computation takes into account the below conditions:

- ISA conditions
- No wind
- Optimum diversion level after engine failure
- Single engine diversion speed schedule.

Note: *Obstacles have not to be considered to determine if a route is or is not an ETOPS route.*

MAXIMUM DIVERSION DISTANCE							
SPEED SCHEDULE	A/C WEIGHT AT CRITICAL POINT (KG)	FL FOR DIVERSION	DIVERSION TIME (MIN)				
			60	90	120	180	240
MCT/330KT	150000	190	439	652	866	1294

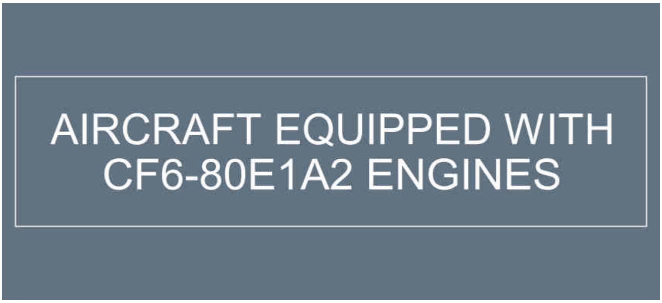
GENERAL

Ident.: PRO-SPO-42B-10-00023737.0002001 / 17 NOV 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

This supplement gives the conditions and procedures to operate temporarily an A330-202, initially fitted with CF6-80E1A4 engines, with one or two CF6-80E1A2 engines, provided that the associated SB is installed.
The remaining CF6-80E1A4 engine must be modified and rated as a CF6-80E1A2 engine. Except as amended or supplemented herein, limitations, procedures, performance of this Flight Crew Operating Manual remain applicable.
This engine intermix configuration is indicated in the cockpit with the following placard:



Intentionally left blank

LIMITATIONS

Ident.: PRO-SPO-42B-20-00023738.0002001 / 17 NOV 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

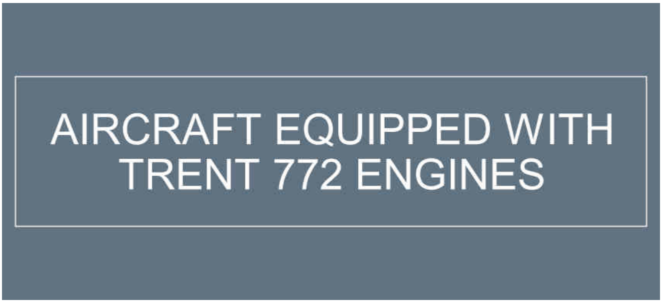
Reduced thrust takeoff and derated takeoff are not allowed.

Intentionally left blank

GENERAL

Ident.: PRO-SPO-42C-10-00023739.0003001 / 17 NOV 20
Applicable to: LV-KHT, LV-KHU

This supplement gives the conditions and procedures to operate temporarily an A330-343, initially fitted with RR 772B engines, with one or two RR 772 engines, provided that the associated SB is installed.
The remaining RR 772B engine must be modified and rated as a RR 772 engine.
Except as amended or supplemented herein, limitations, procedures, performance of this Flight Crew Operating Manual remain applicable.
This engine intermix configuration is indicated in the cockpit with the following placard:



AIRCRAFT EQUIPPED WITH
TRENT 772 ENGINES

Intentionally left blank

LIMITATIONS

Ident.: PRO-SPO-42C-20-00023740.0003001 / 17 NOV 20
Applicable to: LV-KHT, LV-KHU

Reduced thrust takeoff and derated takeoff are not allowed.

Intentionally left blank

GENERAL

Ident.: PRO-SPO-50-00020723.0001001 / 17 MAR 17
Applicable to: ALL

The A330 and A340 aircraft systems are designed to comply with the design criteria of the EASA and FAA regulations (documents references provided in the AFM) for the RVSM capability.
In addition, operators must obtain an operational approval from their national airworthiness authorities, in order to operate within the RVSM airspace. The EASA and FAA regulations (documents references provided in the AFM) also indicate the requirements for obtaining operational approval.

REQUIRED EQUIPMENTS/FUNCTIONS FOR RVSM

Ident.: PRO-SPO-50-00020724.0001001 / 17 MAR 17
Applicable to: ALL

RVSM regulations require the following equipment/functions to be operative :

- 2 ADRs + 2 DMCs
- 1 transponder
- 1 autopilot function
- 1 FCU channel (for altitude target selection and OP CLB/OP DES mode engagement)
- 2 PFD functions (for altitude indication)
- 1 FWC (for altitude alert function).

RVSM NORMAL PROCEDURE

Ident.: PRO-SPO-50-00020726.0001001 / 22 MAR 17
Applicable to: ALL

For flights in RVSM airspace, the flight crew must apply the standard procedures, in addition to the following RVSM procedures.

FLIGHT PREPARATION

The flight crew must take into account the conditions that may affect operations in RVSM airspace, including:

RVSM APPROVAL..CHECK

L2 *Verify that the aircraft is approved for RVSM operations.*

L1 WEATHER..CHECK

L2 *Review the weather forecasted for the flight route. If severe turbulence is expected, this may affect the ability to maintain aircraft altitude.*

L1 REQUIRED EQUIPMENT FOR RVSM ....CHECK

L2 *Check that the required equipment is operative (MEL).*

The flight crew should review the maintenance logs and forms, in order to ensure that the equipment required for RVSM is satisfactory.

L1 ALTITUDES .... CHECK

L2 *Check that the difference between each altitude indications (in the QNH reference) displayed on PFDs and the airport elevation is less than 75 ft.*
Check that the difference between the two primary altitude indications on the PFDs is less than the tolerance specified in the SOP. *Refer to PRO-NOR-SOP-06 Glareshield - EFIS Control Panel.*

L1 IN FLIGHT

BEFORE ENTERING RVSM AIRSPACE

REQUIRED EQUIPMENT FOR RVSM .... OPERATIVE

L2 *If any of the required equipment fails before the aircraft enters RVSM airspace, the flight crew must request new clearance, to avoid this airspace.*

L1 ALTITUDES .... CHECK

L2 *Check on the PFDs that the difference between the altitude indications (in the standard baro setting) is less than the specified tolerance in the table below.*
If only two ADRs are operative, the altimeter indications on PFD and standby altimeter should be recorded. This information may be useful in case of subsequent PFD altitude discrepancy or loss of both remaining ADRs.

L1

		Comparison of Altitude Indications (ft)		
Flight Level	**Speed or Mach Number**	**Difference between ADR 1 and ADR 2 (on PFDs)**	**Difference between ADR 3 and ADR 1/2 (on PFDs)**	**Difference between STBY ALT and ADRs (on PFDs)**
FL 50	250 kt	55 (17 m)	55 (17 m)	90 (27 m)
FL 100	250 kt	60 (18 m)	60 (18 m)	130 (40 m)
FL 200	300 kt	95 (29 m)	100 (30 m)	220 (67 m)
FL 300	M 0.82	120 (37 m)	130 (40 m)	320 (98 m)
FL 410	M 0.82	145 (44 m)	150 (46 m)	380 (116 m)

IN RVSM AIRSPACE

AP .... KEEP ENGAGED

L2 *Ensure that autopilot is engaged for cruise, and for flight level changes.*

L1 AP GUIDANCE .... MONITOR

L2 *During flight level transitions, do not exceed or go below the assigned flight level by more than 150 ft.*

L1

- **Approximately every hour:**
  ALTITUDES .... CHECK

L2 *Check that the difference between the altitude on PFDs is less than the specified tolerance. For more information, See the above "Comparison or Altitude Indications" table.*

Regular check of the flight deck instruments should be sufficient.

L1 AT THE END OF THE FLIGHT

ANY MALFUNCTIONS or DEVIATIONS...REPORT

L2 *Report any malfunction of the systems that enable the aircraft to maintain altitude, including:*
- *Any malfunction or loss of required equipment*
- *Any deviation involving the functions that enable the aircraft to maintain altitude.*

RVSM ABNORMAL AND EMERGENCY PROCEDURE

Ident.: PRO-SPO-50-00020727.0001001 / 17 MAR 17
Applicable to: ALL

ATC...NOTIFY

When the aircraft is in RVSM airspace, the flight crew must notify the ATC of the following situations, because they may affect the aircraft's ability to maintain the flight level:
- *The failure of both autopilots*
- *The loss of altimeter system redundancy (only one PFD indication remaining)*
- *An excessive discrepancy in altitude indications, and no way to identify the valid indication*
- *The failure of any other equipment, that affects the aircraft's ability to maintain the flight level*
- *The encounter of greater than moderate turbulence.*

If the flight crew cannot notify the ATC or obtain the ATC clearance before deviating from the assigned flight level, they should follow the established contingency procedure and obtain the ATC clearance as soon as possible.

Intentionally left blank

GENERAL

Applicable to: ALL

Ident.: PRO-SPO-51-A-00015657.0001001 / 21 MAR 17

GENERAL

The Performance Based Navigation (PBN) concept implies that the aircraft follows the defined track with a requested navigation performance. The PBN includes RNAV and RNP operations.
For RNAV and RNP operations, an operational approval from the airline's national authorities may be required.
The AFM provides regulatory compliances associated with PBN operations.

Ident.: PRO-SPO-51-A-00015659.0001001 / 09 SEP 14

RNAV/RNP CAPABILITY

Before the aircraft enters an RNAV/RNP airspace, RNAV/RNP capability is based on:
- The required RNAV/RNP equipment that is described in each RNAV/RNP section of the FCOM
- Navigation Accuracy HIGH displayed on the MCDU PROG page
- Any specific local requirements published in the Aeronautical Information Publication (AIP).

When the aircraft flies in RNAV/RNP airspace, RNAV/RNP capability is based on:
- Navigation Accuracy HIGH displayed on the MCDU PROG page
- Any specific local requirements published in the Aeronautical Information Publication (AIP).

RNAV 10 / RNP 10

Applicable to: ALL

Ident.: PRO-SPO-51-B-00015675.0001001 / 09 SEP 14

GENERAL

RNAV 10 operations correspond to RNP 10 operations.
In RNAV 10 airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-B-00015676.0001001 / 10 MAY 21

REQUIRED RNAV 10 EQUIPMENT

The minimum navigation equipment required to enter RNAV 10 airspace is:
- Two FMGECs (or one FMGEC and one BACK UP NAV)
- Two MCDUs
- Two IRS

- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side)
- One GPS if the flight time outside radio navaid coverage is longer than:
  - 6.2 hr from the time of IRS ground alignment, or
  - 5.7 hr from the time of the last FM position update.

Ident.: PRO-SPO-51-B-00015756.0001001 / 21 MAR 17

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGEC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If the GPS PRIMARY LOST ◁ message is displayed on both NDs/MCDUs, RNAV 10 operations can be continued:**
  - With no time restriction if radio navaids update is available
  - For 5.7 hr from the time of the last position update if radio navaids update is not available. After 5.7 hr, the navigation accuracy must be considered LOW regardless of the navigation accuracy that is displayed on the MCDU PROG page.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page ◁ in order to identify which FMGEC position is correct:**
  - FMS 1/FMS 2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGEC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**
  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNAV 10 capability is lost.

RNAV 5 / BRNAV

Applicable to: ALL

Ident.: PRO-SPO-51-C-00015672.0001001 / 21 MAR 17

GENERAL

RNAV 5 operations correspond to European BRNAV operations.

Ident.: PRO-SPO-51-C-00015673.0001001 / 10 MAY 21

REQUIRED RNAV 5 EQUIPMENT

The minimum navigation equipment required to enter RNAV 5 airspace is:

- One FMGEC
- One MCDU
- One GPS or one DME receiver to update FM position
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side)
- One IRS.

Ident.: PRO-SPO-51-C-00015757.0001001 / 24 NOV 23

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

● **If one of the following messages is displayed, the flight crew should resume navigation with the FMGEC that provides the correct position:**

- GPS PRIMARY LOST ◁ on one ND/MCDU
- NAV ACCUR DOWNGRAD on one ND/MCDU.

● **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the position data via the MCDU PROG page in order to identify which FMGEC position is correct:**

- GPS PRIMARY LOST ◁ on both NDs/MCDUs
- FMS1/FMS2 POS DIFF
- CHECK IRS 1(2)(3)/FM POSITION ◁
- CHECK A/C POSITION ◁
- NAV FM/GPS POS DISAGREE ◁ .

The flight crew should resume navigation with the FMGEC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**
  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

  If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNAV 5 capability is lost.

RNAV 1 RNAV 2 / P-RNAV - TERMINAL RNAV

Applicable to: ALL

Ident.: PRO-SPO-51-D-00015669.0001001 / 21 MAR 17

GENERAL

RNAV 1(2) operations correspond to P-RNAV TERMINAL RNAV operations.
The AIP may specify that GPS equipment is required.

Ident.: PRO-SPO-51-D-00015670.0001001 / 10 MAY 21

REQUIRED RNAV 1(2) EQUIPMENT

The minimum navigation equipment required to enter RNAV 1/RNAV 2 airspace is:
- One FMGEC
- One MCDU
- One GPS or one DME receiver to update the FM position
- Two IRS
- One FD in NAV mode
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-D-00015758.0001001 / 24 NOV 23

PROCEDURE

BEFORE ENTERING RNAV 1(2) AIRSPACE

The FMS navigation database provides the terminal procedure (RNAV SID, RNAV STAR, RNAV TRANSITION, etc.) of the flight plan. The flight crew must crosscheck the terminal procedure from the published charts with the FMS navigation database on the F-PLN page (waypoint sequences, tracks, distances, and altitude or speed constraints). The flight crew must not modify the procedure that is provided by the navigation database, unless required by the ATC (DIR TO radar vectoring, insertion of waypoints from the navigation database).

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGEC that provides the correct position:**
  - GPS PRIMARY LOST on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following messages is displayed, the flight crew should check the position data via the MCDU PROG page in order to identify which FMGEC position is correct:**
  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION
  - CHECK A/C POSITION
  - NAV FM/GPS POS DISAGREE .

  The flight crew should resume navigation with the FMGEC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNAV 1(2) capability is lost.

RNP 4

Applicable to: ALL

Ident.: PRO-SPO-51-E-00015666.0001001 / 09 SEP 14

GENERAL

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-E-00015667.0001001 / 10 MAY 21

REQUIRED RNP 4 EQUIPMENT

The minimum navigation equipment required to enter RNP 4 airspace is:
- Two FMGECs (or one FMGEC and one BACK UP NAV)
- Two MCDUs
- Two IRS
- One GPS
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-E-00015759.0001001 / 21 MAR 17

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGEC that provides the correct position:**
  - GPS PRIMARY LOST on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page in order to identify which FMGEC position is correct:**
  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ⊲
  - CHECK A/C POSITION ⊲
  - NAV FM/GPS POS DISAGREE

  The flight crew should resume navigation with the FMGEC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**
  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

  If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNP 4 capability is lost.

RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA

Applicable to: ALL

Ident.: PRO-SPO-51-I-00021313.0001001 / 21 MAR 17

GENERAL

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-I-00021314.0001001 / 10 MAY 21

REQUIRED RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA EQUIPMENT

The minimum navigation equipment required to enter RNP 2 oceanic and remote continental airspace is:

- Two FMGECs (or one FMGEC and one BACK UP NAV)
- Two MCDUs
- Two IRS
- One GPS
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-I-00021315.0001001 / 21 MAR 17

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 2 in oceanic and remote continental area operations.

Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGEC that provides the correct position:**
  - GPS PRIMARY LOST on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.

- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page in order to identify which FMGEC position is correct:**
  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS 1/FMS 2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE

  The flight crew should resume navigation with the FMGEC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform ATC that the RNP 2 capability is lost.

RNP 2 IN DOMESTIC AREA

Applicable to: ALL

Ident.: PRO-SPO-51-J-00021316.0001001 / 10 MAY 21

REQUIRED RNP 2 IN DOMESTIC AREA EQUIPMENT

The minimum navigation equipment required to enter RNP 2 domestic airspace is:

- One FMGEC
- One MCDU
- One GPS
- Two IRS
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-J-00021317.0001001 / 24 NOV 23

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 2 in domestic area operations.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGEC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the position data via the MCDU PROG page in order to identify which FMGEC position is correct:**
  - GPS PRIMARY LOST ◁ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁ .

  The flight crew should resume navigation with the FMGEC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform ATC that the RNP 2 capability is lost.

RNP 1 / TERMINAL RNP 1 - BASIC RNP 1

Applicable to: ALL

Ident.: PRO-SPO-51-F-00015660.0001001 / 21 MAR 17

GENERAL

RNP 1 operations correspond to RNP 1 Terminal operations.

Ident.: PRO-SPO-51-F-00015662.0001001 / 10 MAY 21

REQUIRED RNP 1 EQUIPMENT

The minimum navigation equipment required to enter RNP1 airspace is:

- One FMGEC
- One MCDU
- One GPS
- Two IRS
- One FD in NAV mode
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-F-00015762.0001001 / 24 NOV 23

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 1 operations.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

BEFORE ENTERING RNP 1 AIRSPACE

The FMS navigation database provides the terminal procedure (RNAV SID, RNAV STAR, RNAV TRANSITION, etc.) of the flight plan. The flight crew must check the terminal procedure from the published charts with the FMS navigation database on the F-PLN page (waypoint sequences, tracks, distances, and altitude or speed constraints). The flight crew must not modify the procedure that is provided by the navigation database, unless required by the ATC (DIR TO, radar vectoring, insertion of waypoints from the navigation database).

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGEC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.

- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the position data via the MCDU PROG page in order to identify which FMGEC position is correct:**
  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION
  - CHECK A/C POSITION
  - NAV FM/GPS POS DISAGREE .

  The flight crew should resume navigation with the FMGEC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNP 1 capability is lost.

RNP APCH / RNAV(GNSS)

Applicable to: ALL

Ident.: PRO-SPO-51-G-00015654.0001001 / 21 MAR 17

GENERAL

RNP APCH operations correspond to RNAV(GNSS) or RNAV(GPS) operations.

Ident.: PRO-SPO-51-G-00015652.0001001 / 11 JUL 17

REQUIRED RNP APCH EQUIPMENT

The minimum equipment required to start RNP APCH operations is:
- One FMGEC
- One GPS
- One MCDU
- Two IRS
- One FD
- One PFD on the PF side
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on the PM side)
- Two FCU channels.

Ident.: PRO-SPO-51-G-00015768.0001001 / 10 MAY 21

PROCEDURE

Refer to PRO-NOR-SOP-18-C Approach using FINAL APP Guidance - General.

Refer to PRO-NOR-SOP-18-C Approach using FPA Guidance - General.

RNP AR / RNAV(RNP)

Ident.: PRO-SPO-51-H-00012751.0002001 / 09 MAY 17
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

GENERAL

RNP AR operations correspond to RNAV(RNP) operations.
For RNP AR operations, the flight crew should refer to the specific procedures published by the airline.
The airline must obtain an operational approval and the flight crew must be qualified for this type of operations. To obtain this operational approval the airline should refer to the AFM and the associated Airworthiness Compliance Document (ACD). The approved RNP values are given in the AFM and the ACD.
The main procedure steps for RNP AR have been introduced in the Procedures of this FCOM and in the paragraph below. This does not relieve the airline from the need to provide the flight crew with tailored procedures when required.

Ident.: PRO-SPO-51-H-00012752.0002001 / 03 NOV 22
Applicable to: LV-KHT, LV-KHU

REQUIRED RNP AR EQUIPMENT

The minimum equipment required to start RNP AR operations is:
- 2 FMGEC
- 2 MCDU
- 2 FD
- 1 AP at least
- 2 PFD with V/DEV displays
- 2 ND
- 2 GPS (MMR)
- 3 ADIRS in NAV mode
- TAWS with display of terrain
- FCU with both channels
- 1 FWC

Ident.: PRO-SPO-51-H-00012752.0003001 / 03 NOV 22
Applicable to: LV-KAN, LV-KAO

REQUIRED RNP AR EQUIPMENT

The minimum equipment required to start RNP AR operations is:
- 2 FMGEC
- 2 MCDU

- 2 FD
- 1 AP (2 AP if RNP less than 0.3 is required or missed approach less than 1 NM)
- 2 PFD with L/DEV and V/DEV displays
- 2 ND
- 2 GPS (MMR)
- 3 ADIRS in NAV mode
- TAWS with display of terrain
- FCU with both channels
- 1 FWC

Ident.: PRO-SPO-51-H-00014562.0004001 / 24 FEB 23
Applicable to: LV-KAN, LV-KAO

PROCEDURES

The availability of GPS PRIMARY for the estimated time of operation must be verified with an appropriate GPS prediction tool before dispatch.

Prior to starting RNP AR instrument procedures, check that:
- OAT and wind, as applicable, are within limits
- The FMS lateral and vertical F-PLN extracted from the navigation database is in accordance with the instrument procedure chart
- Two GPS sensors are in NAV or SBAS ◁* on GPS MONITOR page
- The correct RNP value is displayed on MCDU with HIGH accuracy
- GPS PRIMARY is available.

If obstacles, GPWS TERRAIN display must be selected on both ND unless weather radar monitoring is required on one side.
Airspeed and configuration must be adapted for the radius of turns in the procedure.

DEPARTURE

Before takeoff, check that NAV is armed.
When NAV is indicated active on FMA and at 100 ft, select AP ON.
Monitor lateral deviation using the L/DEV on PFD.
Callout must be performed when L/DEV reaches ½ dot.
If L/DEV increases towards 1 RNP, take over manually using FD and the L/DEV indication to fly back on the intended flight plan and reengage AP as applicable.

APPROACH

Refer to FCOM-PRO-NOR-SOP-18-C Approach using FINAL APP Guidance for RNAV(RNP) - General.

GO-AROUND

Refer to FCOM-PRO-NOR-SOP-20 Go Around - Go Around Initiation.

ABNORMAL OPERATIONS

Detailed information is provided in the ACD for the airline to develop contingency procedures adapted to each operation.
The flight crew must be trained to conduct departure or missed approach procedures with system failures to ensure a safe extraction.

ENGINE FAILURE

In the case of engine failure during departure or a missed approach procedure, the flight crew must consider the bank angle limitation when flying at a speed below the maneuvering speed. Turns in the procedure may require bank angles above 15 °. Flying with one engine inoperative affects the aircraft lateral performance. The flight crew should be trained and instructed to disconnect AP if the aircraft deviates from the intended track. This training must consider turning and straight legs as appropriate.

Ident.: PRO-SPO-51-H-00014562.0003001 / 24 FEB 23
Applicable to: LV-KHT, LV-KHU

PROCEDURES

The availability of GPS PRIMARY for the estimated time of operation must be verified with an appropriate GPS prediction tool before dispatch.

Prior to starting RNP AR instrument procedures, check that:
- OAT and wind, as applicable, are within limits
- The FMS lateral and vertical F-PLN extracted from the navigation database is in accordance with the instrument procedure chart
- Two GPS sensors are in NAV or SBAS ◁✻ on GPS MONITOR page
- The correct RNP value is displayed on MCDU with HIGH accuracy
- GPS PRIMARY is available.

If obstacles, GPWS TERRAIN display must be selected on both ND unless weather radar monitoring is required on one side.
Airspeed and configuration must be adapted for the radius of turns in the procedure.

DEPARTURE

Before takeoff, check that NAV is armed.
When NAV is indicated active on FMA and at 100 ft, select AP ON.
Monitor lateral deviation using the XTK on ND.
Callout must be performed when XTK is at or above 0.1 NM.

If XTK increases towards 1 RNP, take over manually using FD indication to fly back on the intended flight plan and using ND and XTK to reengage AP as applicable.

APPROACH

Refer to FCOM-PRO-NOR-SOP-18-C Approach using FINAL APP Guidance for RNAV(RNP) - General.

GO-AROUND

Refer to FCOM-PRO-NOR-SOP-20 Go Around - Go Around Initiation.

ABNORMAL OPERATIONS

Detailed information is provided in the ACD for the airline to develop contingency procedures adapted to each operation.
The flight crew must be trained to conduct departure or missed approach procedures with system failures to ensure a safe extraction.

ENGINE FAILURE

In the case of engine failure during departure or a missed approach procedure, the flight crew must consider the bank angle limitation when flying at a speed below the maneuvering speed. Turns in the procedure may require bank angles above 15 °. Flying with one engine inoperative affects the aircraft lateral performance. The flight crew should be trained and instructed to disconnect AP if the aircraft deviates from the intended track. This training must consider turning and straight legs as appropriate.

GENERAL

Ident.: PRO-SPO-52-00021947.0001001 / 09 FEB 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

GENERAL

The Performance-Based Communication and Surveillance (PBCS) concept provides performance requirements for communication and surveillance operations. PBCS supports the required performance for Air Traffic Management (ATM).

The PBCS concepts sets the following performance parameters:
- The Required Communication Performance (RCP) specification that defines performance requirements associated to a communication transaction.
  A communication transaction is performed between the ATC controller and the flight crew (clearance, flight information, or request).
  Performance requirements are specified for each part of the communication chain (aircraft, air/ground network, and ATC).
  The RCP specification impacts CPDLC and SATCOM voice communications on the aircraft.
  The RCP specification is identified by a designator (e.g. RCP 240, RCP 400) where the value refers to the maximum time (in seconds) for the ATC controller to initiate an ATC clearance and receive the response from the flight crew.
- The Required Surveillance Performance (RSP) specification that defines performance requirements associated to the delivery of surveillance data.
  Performance requirements are specified for each part of the communication chain (aircraft, air/ground network, and ATC).
  The RSP specification impacts ADS-C and SATCOM voice communications on the aircraft.
  The RSP specification is identified by a designator (e.g. RSP 180, RSP 400) where the value refers to a maximum time (in seconds) to deliver the surveillance data (e.g. aircraft position) to the ATC.

The RCP and/or RSP specifications apply to a defined airspace, route, or procedure with optimized operations (e.g. reduced separations).

REQUIREMENTS

Ident.: PRO-SPO-52-00021948.0001001 / 09 FEB 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Aircraft Performance Capability for Communication and Surveillance	Required Onboard Configuration to Maintain Aircraft Performance Capability	
	Applications that Support Aircraft Performance Capability	**Communication Means that Support Applications**
RCP 240	CPDLC	VHF datalink or SATCOM datalink
RSP 180	ADS-C	VHF datalink or SATCOM datalink

PROCEDURE

Ident.: PRO-SPO-52-00021949.0001001 / 09 FEB 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

MANAGEMENT OF DEGRADED DATALINK COMMUNICATION AND SURVEILLANCE

In PBCS airspace with RCP/RSP requirements, if the ATC datalink application or the communication means associated to a required RCP/RSP level are lost, the flight crew should notify ATC that RCP and/or RSP capability are lost.

OVERVIEW

Ident.: PRO-SPO-85-00020619.0001001 / 28 NOV 19
Applicable to: ALL

Simultaneous Parallel Approach operations permit ILS/RNAV(GNSS)/RNAV(RNP)/GLS instrument approaches to be performed to dual or triple parallel runway configurations.

Two types of simultaneous approaches to parallel or near-parallel instrument runways exist:
- Independent Approaches, where radar separation minima between aircraft on adjacent extended runway center lines are not prescribed and approaches are monitored to ensure aircraft do not enter a No Transgression Zone (NTZ). A Precision Runway Monitor (PRM) system which enables simultaneous close parallel approaches may also be employed. The air traffic controllers use the PRM system to monitor the aircraft position.
- Dependent Approaches, where radar separation minima between aircraft on adjacent extended runway center lines are prescribed and aircraft are staggered to provide separation from the adjacent final course.

To perform Simultaneous Parallel Approach operations:

- The ATC and flight crew must satisfy specific training requirements.
- The ATC and the aircraft equipment must also comply with specific requirements.

BREAK OUT TURN AND CLIMB PROCEDURE

Ident.: PRO-SPO-85-00020620.0001001 / 17 MAR 17
Applicable to: ALL

Simultaneously:

AP.. OFF
BREAK OUT LEFT(RIGHT), HDG___, ALT___.. ANNOUNCE
THRUST LEVERS..TOGA, and back to CL

L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
The FMS GO-AROUND phase becomes active. Thus, the FMS reinserts the approach.

L1 TURN LEFT(RIGHT) AND CLIMB

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

Then

L1 HDG___ .... TURN AND PULL

L2 *The GA TRK mode disengages, and the HDG mode engages.*

L1 ALT___ .... TURN AND PULL

L2 *The SRS GA mode disengages, and the OP CLB mode engages. The speed target becomes the FMS speed target of the CLIMB phase.*

L1 SPEED .... PULL AND ADJUST

L2 *For the initial break out procedure, adjust the speed (e.g. 160 kt), in order to avoid a significant acceleration, and an increase in workload.*

L1 ● **When established on the break out path:**

AP .... ON

L2 *Before engaging the AP, ensure that the FD bar orders correspond to the aircraft current path.*

L1 SPEED .... SELECT AS RQRD

FLAPS .... AS RQRD

GEAR .... AS RQRD

TCAS MODE SEL .... TA/RA AS RQRD

BREAK OUT TURN AND DESCENT PROCEDURE

Ident.: PRO-SPO-85-00020621.0001001 / 04 DEC 18

Applicable to: ALL

Simultaneously:

AP .... OFF

BREAK OUT LEFT(RIGHT), HDG___, ALT___ .... ANNOUNCE

TURN LEFT(RIGHT) AND MAINTAIN RATE OF DESCENT

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

Then

L1 HDG___.. TURN AND PULL

L2 *The HDG mode engages. The vertical mode reverts to the V/S mode. The vertical speed target is the aircraft vertical speed at V/S engagement.*

L1 ALT___.. TURN AND PULL

L2 *This action defines an altitude target. The OP DES mode and the THR IDLE mode engage. The speed target does not change.*

L1 V/S.. MONITOR

CAUTION	*Depending on the speed target, the vertical speed may become excessive. If the rate of descent exceeds 1 000 ft/min, engage the V/S mode and limit the rate of descent to 1 000 ft/min.*

- **When established on the break out path:**

  AP.. ON

L2 *Before engaging the AP, ensure that the FD bar orders correspond to the aircraft current path.*

L1
- **When cleared by ATC:**

  ALT___.. TURN

L2 *Select an altitude target for go-around, in accordance with the ATC clearance.*

L1 THRUST LEVERS.. TOGA, and back to CL

L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
The FMS GO-AROUND phase becomes active.

L1 HDG___.. PULL

L2 *The GA TRK mode disengages, and the HDG mode engages. The SRS GA mode remains engaged, until ALT* engagement.*

L1 SPEED.. SELECT AS RQRD
FLAPS.. AS RQRD
GEAR.. AS RQRD
TCAS MODE SEL.. TA/RA AS RQRD

PASSENGER AND CARGO DOORS OPERATION

The following are the wind limitations for passenger and cargo doors operation:

- The maximum wind for passenger door operation is 40 kt (or 50 kt , if the aircraft nose is into the wind).
- The maximum wind for FWD and AFT cargo doors operation is 40 kt (or 50 kt , if the aircraft nose is into the wind, or if the FWD and AFT cargo doors are on the downwind side of the aircraft).
- The passenger, FWD and AFT cargo doors must be closed before the wind speed exceeds 60 kt.

Ident.: LIM-AG-OPS-ARPT_WIND-00020759.0009001 / 10 MAY 21
Applicable to: LV-KHT, LV-KHU

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00001822.0014001 / 21 MAR 11
Applicable to: LV-KAN, LV-KAO

Maximum taxi weight	233 900 kg (515 661 lb)
Maximum takeoff weight (brake release)	233 000 kg (513 676 lb)
Maximum landing weight	182 000 kg (401 241 lb)
Maximum zero fuel weight	170 000 kg (374 785 lb)
Minimum weight	116 000 kg (255 737 lb)

In exceptional conditions (inflight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided that the pilot follows the overweight landing procedure.

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00001822.0393001 / 18 MAR 11
Applicable to: LV-FVH, LV-FVI, LV-GKO, LV-GKP

Maximum taxi weight	238 900 kg (526 684 lb)
Maximum takeoff weight (brake release)	238 000 kg (524 700 lb)
Maximum landing weight	182 000 kg (401 241 lb)
Maximum zero fuel weight	168 000 kg (370 376 lb)
Minimum weight	116 000 kg (255 737 lb)

In exceptional conditions (inflight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided that the pilot follows the overweight landing procedure.

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00001822.0469001 / 09 JUN 15
Applicable to: LV-GHQ, LV-GIF

Maximum taxi weight	242 900 kg (535 502 lb)
Maximum takeoff weight (brake release)	242 000 kg (533 518 lb)
Maximum landing weight	182 000 kg (401 241 lb)
Maximum zero fuel weight	166 000 kg (365 967 lb)
Minimum weight	116 000 kg (255 737 lb)

In exceptional conditions (inflight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided that the pilot follows the overweight landing procedure.

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00001822.0409001 / 23 SEP 11
Applicable to: LV-KHT, LV-KHU

Maximum taxi weight 1	238 900 kg (526 684 lb)
Maximum takeoff weight 1 (brake release)	238 000 kg (524 700 lb)
Maximum taxi weight 2	236 900 kg (522 275 lb)
Maximum takeoff weight 2 (brake release)	236 000 kg (520 291 lb)
Maximum landing weight	182 000 kg (401 241 lb)
Maximum zero fuel weight 2	170 000 kg (374 785 lb)
Maximum zero fuel weight 1	168 000 kg (370 376 lb)
Minimum weight	116 000 kg (255 737 lb)

Multiple MTOW and MZFW are certified. A placard fitted on the aircraft must reflect the current MTOW and MZFW.

In exceptional conditions (inflight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided that the pilot follows the overweight landing procedure.

APU Bleed Use with HP Air Start Unit.... B
Cabin Pressure....C
Packs Use with LP Air Conditioning Unit....D

Intentionally left blank

GENERAL

Ident.: LIM-AIR-00020648.0001001 / 17 MAR 17
Applicable to: ALL

With passengers on board, it is not recommended to exceed 20 min without air conditioning supply. The lack of fresh air supply will significantly reduce the cabin's air quality.

APU BLEED USE WITH HP AIR START UNIT

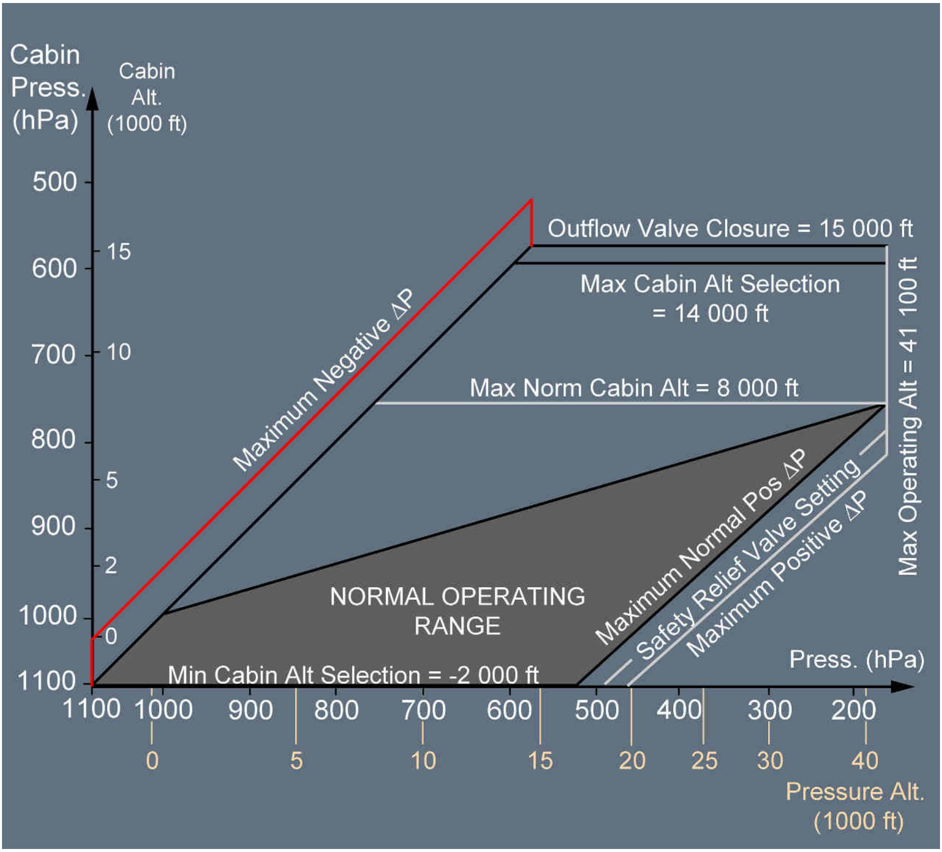
Ident.: LIM-AIR-00019987.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew must not use bleed air from the APU BLEED and from the HP Air Start Unit at the same time, to prevent any adverse effect on the Bleed Air System.

CABIN PRESSURE

Ident.: LIM-AIR-00019990.0007001 / 17 MAR 17
Applicable to: LV-GKO, LV-GKP

Maximum positive differential pressure	9.25 PSI
Maximum negative differential pressure	-0.73 PSI
Safety relief valve setting	8.85 PSI



Note: 1. *Maximum differential pressure (Δp) and safety valve setting tolerance = ± 7 hPa (0.1 PSI).*

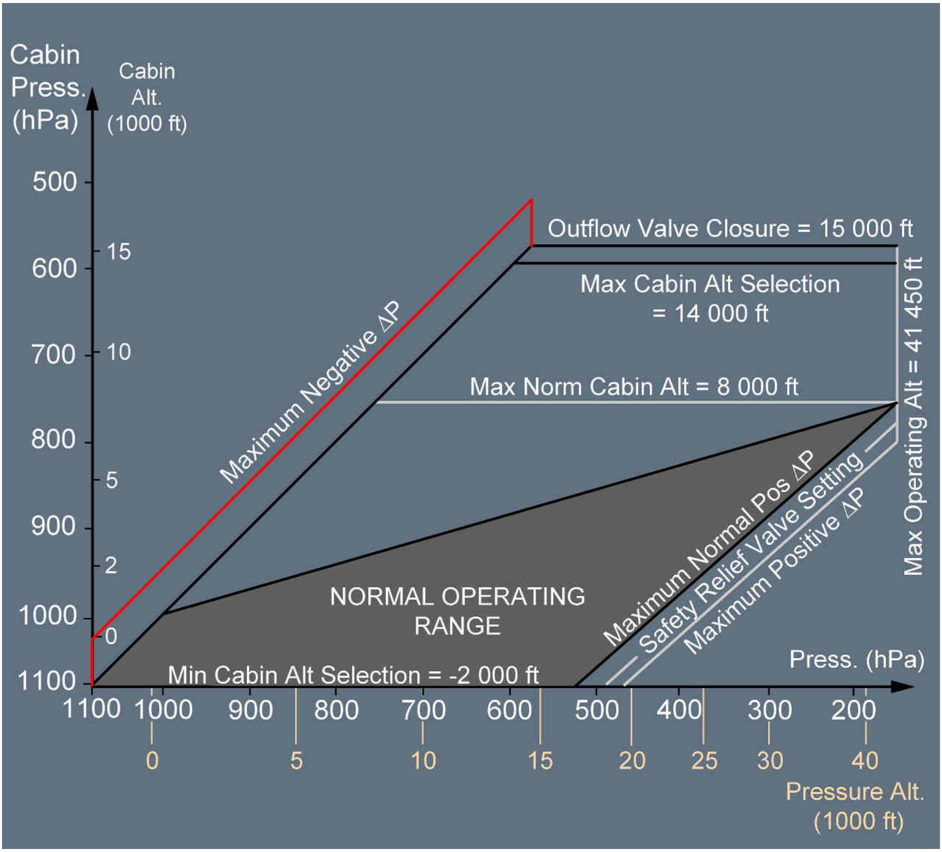
2. *Depending on CPC standard, for flights longer than 2.5 h, the maximum normal cabin altitude can be limited to 7 350 ft.*

CABIN PRESSURE

Ident.: LIM-AIR-00019990.0014001 / 17 MAR 17

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Maximum positive differential pressure	9.25 PSI
Maximum negative differential pressure	-0.73 PSI
Safety relief valve setting	8.85 PSI



Note: 1. *Maximum differential pressure (Δp) and safety valve setting tolerance = ± 7 hPa (0.1 PSI).*
2. *Depending on CPC standard, for flights longer than 2.5 h, the maximum normal cabin altitude can be limited to 7 460 ft.*

PACKS USE WITH LP AIR CONDITIONING UNIT

Ident.: LIM-AIR-00019986.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew must not use conditioned air from the packs and from the LP Air Conditioning Unit at the same time, to prevent any adverse effect on the Air Conditioning system.

AUTOPILOT FUNCTION

Applicable to: ALL

Ident.: LIM-AFS-10-10-00020138.0001001 / 17 MAR 17

The autopilot can be used with the following minimum values:

Ident.: LIM-AFS-10-10-00020140.0001001 / 23 JUL 18

At takeoff	100 ft AGL and at least 5 s after liftoff

Ident.: LIM-AFS-10-10-00020141.0001001 / 23 JUL 18

In approach with F-G/S mode	200 ft AGL
In approach with FINAL APP, V/S or FPA mode	250 ft AGL

Ident.: LIM-AFS-10-10-00020142.0001001 / 17 MAR 17

In circling approach	500 ft AGL

Ident.: LIM-AFS-10-10-00020143.0001001 / 15 NOV 21

ILS approach when CAT1 is displayed on the FMA	160 ft AGL
GLS approach when AUTOLAND is not displayed on the FMA	160 ft AGL
LPV approach (with SLS) when CAT1 is displayed on the FMA	160 ft AGL
ILS approach when CAT2 or CAT3 (single or dual) is displayed on the FMA	0 ft AGL if autoland

Ident.: LIM-AFS-10-10-00020144.0001001 / 17 MAR 17

After a manual go-around	100 ft AGL

Ident.: LIM-AFS-10-10-00020145.0001001 / 06 JUL 17

In all other phases	500 ft AGL

The AP or FD in OP DES or DES mode can be used in approach. However, its use is only permitted if the FCU selected altitude is set to, or above, the higher of the two: MDA/MDH or 500 ft AGL.

FLIGHT MANAGEMENT FUNCTION

Ident.: LIM-AFS-10-20-00020162.0001001 / 15 NOV 21

Applicable to: ALL

FMGES lateral and vertical navigation is certified for:

- After takeoff, en route, and terminal area operations
- Navigation within RNAV/RNP airspace
- Instrument approach procedures (except ILS, LOC, LOC B/C, IGS, LDA, SDF, GLS and FLS final approaches)
- Missed approach procedures.

The FLS function is certified for:
- RNAV, RNAV (GNSS) approach with LNAV/VNAV or LNAV minima, GPS, VOR, VOR/DME, NDB, NDB/DME instrument approach procedures, using FMS navigation for lateral and vertical navigation
- LOC, ILS (G/S out), or LOC B/C instrument approaches, using FMS navigation for vertical navigation, associated with LOC or LOC B/C for lateral navigation.

The SLS function is certified for RNAV (GNSS) approach with LPV/LP minima,
Approval of the FMGES is based on the assumption that the navigation database is validated for intended use.
Obstacle clearance and adherence to airspace constraints remains a flight crew responsibility.
Fuel, time predictions/performance information is provided for advisory purpose only.

Ident.: LIM-AFS-10-20-00020163.0002001 / 17 MAR 17
Applicable to: ALL

NAVIGATION PERFORMANCE

The navigation accuracy depends on:
- IRS drift, or
- One of the following:
  - Radio navaid availability, or
  - Elapsed time since last computation of radio navaid position.

RNP accuracy with GPS PRIMARY is:

	With AP ON (1)	With AP OFF and FD ON (1)	With AP OFF and FD OFF
En route	1 NM	1 NM	1.1 NM
In terminal area	0.5 NM	0.51 NM	0.51 NM
In approach	0.3 NM	0.3 NM	With F-LOC deviation: 0.3 NM Without F-LOC deviation: not authorized

(1)
- *In NAV mode (all phases), or*
- *In F-LOC (approach phase).*

Ident.: LIM-AFS-10-20-00020464.0001001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

- **For RNP AR:**
  The aircraft is capable of conducting RNP AR operations when operated in accordance with the recommendations provided in the Airbus Airworthiness Compliance Document (ACD).

RNP AR capability limited to 0.3 NM has been demonstrated with AP ON for the following modes:

- Departure in NAV mode
- Initial and Intermediate approach in NAV mode, or APP NAV mode when convenient
- Final approach in FINAL APP mode
- Missed approach in NAV mode.

Note: *For navigation performance and recommendations regarding RNP AR operations with AP OFF / FD ON, refer to ACD.*

Ident.: LIM-AFS-10-20-00020464.0002001 / 17 MAR 17
Applicable to: LV-KAN, LV-KAO

- **For RNP AR:**

The aircraft is capable of conducting RNP AR operations when operated in accordance with the recommendations provided in the Airbus Airworthiness Compliance Document (ACD).
The achieved RNP AR level could be below 0.3 NM and depends on the type of RNP AR application. Refer to ACD for maximum achievable RNP values.

RNP AR capability has been demonstrated with AP ON for the following modes:

- Departure in NAV mode
- Initial and Intermediate approach in NAV or APP NAV modes
- Final approach in FINAL APP mode
- Missed approach in NAV mode.

Note: *For navigation performance and recommendations regarding RNP AR operations with AP OFF / FD ON, refer to ACD.*

Ident.: LIM-AFS-10-20-00020465.0001001 / 04 JUN 19
Applicable to: ALL

DEGRADED SITUATION

If GPS PRIMARY LOST ◁ is displayed on the ND, the navigation accuracy remains sufficient for RNP operations provided that the RNP value is checked or entered on the MCDU and HIGH ACCURACY is displayed.

USE OF NAV MODE

Applicable to: ALL

Ident.: LIM-AFS-10-30-00020164.0001001 / 17 MAR 17

AFTER TAKEOFF

NAV mode may be used after takeoff provided that:

- GPS PRIMARY ◁ is available, or
- The flight crew checked the FMGES takeoff updating.

Ident.: LIM-AFS-10-30-00020165.0001001 / 17 MAR 17

IN TERMINAL AREA

NAV mode may be used in terminal area provided that:

- GPS PRIMARY ◁ is available, or
- the appropriate RNP is checked or entered on the MCDU, and HIGH accuracy is displayed, or
- FMS navigation is crosschecked with navaid raw data.

Ident.: LIM-AFS-10-30-00020166.0001001 / 17 MAR 17

APPROACH BASED ON RADIO NAVAIDS

A navaids approach may be performed in NAV, APP NAV or FINAL APP, with AP or FD engaged, provided that:

- If GPS PRIMARY ◁ is available, the reference navaids may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided that an operational approval is obtained
- If GPS PRIMARY is not available, the reference navaids and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

Note: *FLS ◁ is the recommended managed lateral and vertical guidance mode for radio navaids approach.*

Ident.: LIM-AFS-10-30-00020167.0001001 / 17 MAR 17

RNAV APPROACH

An RNAV(RNP) approach may be performed, GPS PRIMARY is not available, only if the radio navaid coverage supports the RNP value and HIGH accuracy is displayed on the MCDU with the specified RNP, and an operational approval is obtained.
An RNAV(GNSS) approach may be performed provided that GPS PRIMARY ◁ is available.
Refer to PRO-NOR-SOP-18-A Cross-Reference Table.

Note: *FLS ◁ is the recommended managed lateral and vertical guidance mode for RNAV approach.*

USE OF FLS ⩤

Ident.: LIM-AFS-10-00020168.0001001 / 28 MAY 20
Applicable to: ALL

APPROACH BASED ON RADIO NAVAIDS

A navaids approach (e.g. VOR/DME) may be flown with the FLS provided that:
- F-APP capability is displayed on FMA.
  In this case, the reference navaids may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided an operational approval is obtained.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

An ILS (G/S out), ILS-B/C (G/S out), LOC, LOC-B/C approach may be flown with the lateral LOC (LOC B/C) mode and with the F-G/S mode of FLS function provided that:
- F-APP capability is displayed on FMA.
  In this case, the reference navaids used for the vertical path validation must be tuned and checked at final descent point.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids used for the vertical path validation must be tuned and checked at final descent point and monitored during the approach.

RNAV(GNSS) APPROACH

An RNAV(GNSS) approach with LNAV minimum may be flown with the FLS provided that the F-APP capability is displayed on FMA.
An RNAV(GNSS) approach with LNAV/VNAV minimum must be flown with the FLS provided that the F-APP capability is displayed on FMA.

Note: *The RNAV(GNSS) approach limitations and procedures must be used to perform an RNAV approach for which the GNSS is not required.*

NAVIGATION DATABASE VALIDATION

Ident.: LIM-AFS-10-40-00021525.0006001 / 05 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

RNAV(GNSS) APPROACHES AND APPROACHES BASED ON VOR/NDB

To fly an approach in lateral managed mode or lateral and vertical managed mode, the approach stored in the Navigation Database must be either:
- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, or

- Validated and approved by the Operator.

Note: *RNAV(GNSS) approaches lateral trajectories are geometrically based on waypoints coordinates. Thus, validating waypoints coordinate ensure no coding error on the approach and correct lateral trajectory. Observed lateral track degree of difference between MCDU F-PLN page display and charts may come from inconsistency between FMS MagVar and charted MagVar, which has no effect on lateral trajectory.*

Ident.: LIM-AFS-10-40-00021525.0003001 / 05 MAY 22
Applicable to: LV-GKO, LV-GKP

APPROACHES BASED ON VOR/NDB

To fly an approach in lateral managed mode or lateral and vertical managed mode, the approach stored in the Navigation Database must be either:
- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, or
- Validated and approved by the Operator.

RNAV(GNSS) APPROACHES

To fly an RNAV(GNSS) approach **in lateral managed mode only (NAV/FPA)**, the approach stored in the Navigation Database must be either:
- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, or
- Validated and approved by the Operator.

To fly an RNAV(GNSS) approach **in lateral and vertical managed mode (FINAL APP)**, the approach stored in the Navigation Database must be both:
- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, and
- Validated and approved by the Operator.

Note: *RNAV(GNSS) approaches lateral trajectories are geometrically based on waypoints coordinates. Thus, validating waypoints coordinate ensure no coding error on the approach and correct lateral trajectory. Observed lateral track degree of difference between MCDU F-PLN page display and charts may come from inconsistency between FMS MagVar and charted MagVar, which has no effect on lateral trajectory.*

Ident.: LIM-AFS-10-40-00021525.0004001 / 05 MAY 22
Applicable to: LV-KAN, LV-KAO, LV-KHT, LV-KHU

RNAV(GNSS) APPROACHES AND APPROACHES BASED ON VOR/NDB

To fly an approach in lateral managed mode or lateral and vertical managed mode, the approach stored in the Navigation Database must be either:

- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, or
- Validated and approved by the Operator.

Note: *RNAV(GNSS) approaches lateral trajectories are geometrically based on waypoints coordinates. Thus, validating waypoints coordinate ensure no coding error on the approach and correct lateral trajectory. Observed lateral track degree of difference between MCDU F-PLN page display and charts may come from inconsistency between FMS MagVar and charted MagVar, which has no effect on lateral trajectory.*

RNAV(RNP) APPROACHES

To fly an RNAV(RNP) procedure (departure, approach, missed approach), the procedure stored in the Navigation Database must be both:

- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, and
- Validated and approved by the Operator.

Intentionally left blank

ILS CATEGORY II

Ident.: LIM-AFS-20-00020171.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height..100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
For manual landing, AP should be disconnected no later than 80 ft AGL.

SPECIAL AUTHORIZATION CAT II (SA CAT II)

Ident.: LIM-AFS-20-00020172.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height..100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
With HUD , the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.
Without HUD, the flight crew must perform an automatic landing.

OTHER THAN STANDARD CAT II (OTS CAT II)

Ident.: LIM-AFS-20-00020173.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height..100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
With HUD , the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.
Without HUD, the flight crew must perform an automatic landing.

ILS CATEGORY III FAIL PASSIVE (SINGLE)

Ident.: LIM-AFS-20-00020174.0001001 / 18 SEP 18
Applicable to: ALL

A/THR must be used in selected or managed speed.
One autopilot must be engaged in APPR mode, and CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
Minimum decision height..50 ft

ILS CATEGORY III FAIL OPERATIONAL (DUAL)

Ident.: LIM-AFS-20-00020175.0001001 / 03 NOV 23
Applicable to: ALL

Alert height.. 200 ft
A/THR must be used in selected or managed speed.
Both autopilots must be engaged in APPR mode, and CAT 3 DUAL must be displayed on the FMA.

- **CAT III without DH:**
  Minimum Runway Visual Range...75 m

ENGINE-OUT

Ident.: LIM-AFS-20-00020176.0001001 / 17 MAR 17
Applicable to: ALL

CAT II and CAT III autoland are only approved in Configuration 3, and if engine-out procedures are completed before reaching 1 000 ft in approach.

MAXIMUM WIND CONDITIONS FOR ILS CAT II OR CAT III AND FOR GLS ◁ CAT I

Ident.: LIM-AFS-20-00020178.0001001 / 17 MAR 17
Applicable to: ALL

Headwind: 35 kt
Tailwind : 10 kt
Crosswind 20 kt

Note: *Wind limitation is based on the surface wind reported by the tower. If the wind displayed on the ND exceeds the above-noted autoland limitations, but the tower reports surface wind within the limitations, then the autopilot can remain engaged. If the tower reports surface wind beyond the limitations, only a CAT I automatic approach without autoland can be performed.*

AUTOMATIC LANDING

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Ident.: LIM-AFS-20-10-00020146.0001001 / 17 MAR 17

ILS CAT II and CAT III autoland and GLS CAT I autoland are approved in CONF 3 and CONF FULL.

Ident.: LIM-AFS-20-10-00020147.0001001 / 17 MAR 17

Automatic landing is demonstrated:

- With CAT II and CAT III ILS beam and CAT I GLS beam.

Ident.: LIM-AFS-20-10-00020148.0001001 / 17 MAR 17

- With a glide slope angle between -2.5 ° and -3.25 °
- For airfield elevation below 9 200 ft

Ident.: LIM-AFS-20-10-00020139.0002001 / 17 MAR 17

- For weights above 123 000 kg (271 166 lb)

Ident.: LIM-AFS-20-10-00020153.0005001 / 25 JAN 18

- With aircraft weight below the maximum landing weight

Note: *Depending on the situation (e.g. emergency or other) and provided that the runway is approved for automatic landing, the flight crew can decide to perform an autoland up to 229 t (504 858 lb).*

Ident.: LIM-AFS-20-10-00020151.0001001 / 28 MAY 20

Automatic rollout performance is approved on dry and wet runways, but performance on contaminated runways was not demonstrated.

Ident.: LIM-AFS-20-10-00020152.0001001 / 06 JUL 17

Automatic landing system performance has been demonstrated on CAT II and CAT III ILS beams. However, automatic landing in CAT I, or better weather conditions is possible on CAT I ground installation, or on CAT II/III ground installations when ILS-sensitive areas are not protected, if the following precautions are taken:

- The airline has checked that the ILS beam quality, and the effect of the terrain profile before the runway, have no adverse effect on AP guidance. In particular, the effect of terrain discontinuities within 300 m (974 ft) before the runway threshold must be evaluated.
- The flight crew is aware that LOC or G/S beam fluctuations, independent of the aircraft system, may occur. The PF is prepared to immediately disconnect the AP and to take the appropriate action, should unsatisfactory guidance occur.
- At least CAT 2 capability is displayed on the FMA, and CAT II/III procedures are used.
- Visual references are obtained, at a DH appropriate for the CAT I approach being flown, or a go-around is performed.

AUTOMATIC LANDING

Applicable to: LV-KHT, LV-KHU

Ident.: LIM-AFS-20-10-00020146.0001001 / 17 MAR 17

ILS CAT II and CAT III autoland and GLS ◁ CAT I autoland are approved in CONF 3 and CONF FULL.

Ident.: LIM-AFS-20-10-00020147.0001001 / 17 MAR 17

Automatic landing is demonstrated:

- With CAT II and CAT III ILS beam and CAT I GLS ◁ beam.

Ident.: LIM-AFS-20-10-00020148.0001001 / 17 MAR 17

- With a glide slope angle between -2.5 ° and -3.25 °
- For airfield elevation below 9 200 ft

Ident.: LIM-AFS-20-10-00020139.0001001 / 17 MAR 17

- For weights above 116 000 kg (255 737 lb)

Ident.: LIM-AFS-20-10-00020153.0005001 / 25 JAN 18

- With aircraft weight below the maximum landing weight

Note: *Depending on the situation (e.g. emergency or other) and provided that the runway is approved for automatic landing, the flight crew can decide to perform an autoland up to 229 t (504 858 lb).*

Ident.: LIM-AFS-20-10-00020151.0001001 / 28 MAY 20

Automatic rollout performance is approved on dry and wet runways, but performance on contaminated runways was not demonstrated.

Ident.: LIM-AFS-20-10-00020152.0001001 / 06 JUL 17

Automatic landing system performance has been demonstrated on CAT II and CAT III ILS beams. However, automatic landing in CAT I, or better weather conditions is possible on CAT I ground installation, or on CAT II/III ground installations when ILS-sensitive areas are not protected, if the following precautions are taken:

- The airline has checked that the ILS beam quality, and the effect of the terrain profile before the runway, have no adverse effect on AP guidance. In particular, the effect of terrain discontinuities within 300 m (974 ft) before the runway threshold must be evaluated.
- The flight crew is aware that LOC or G/S beam fluctuations, independent of the aircraft system, may occur. The PF is prepared to immediately disconnect the AP and to take the appropriate action, should unsatisfactory guidance occur.
- At least CAT 2 capability is displayed on the FMA, and CAT II/III procedures are used.
- Visual references are obtained, at a DH appropriate for the CAT I approach being flown, or a go-around is performed.

OIL TEMPERATURE

Maximum continuous temperature... 190 °C
Minimum temperature before takeoff... 50 °C

OIL QUANTITY

The minimum oil quantity is the highest value of:
- 15 qt, or
- 6 qt + estimated consumption.

  Average estimated consumption = 0.7 qt/h.

OIL PRESSURE

Minimum oil pressure...25 PSI

OIL

Ident.: LIM-ENG-00020226.0002001 / 10 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

OIL TEMPERATURE

Maximum continuous temperature... 160 °C
Maximum transient temperature (15 min)... 175 °C
Minimum starting temperature..-40 °C

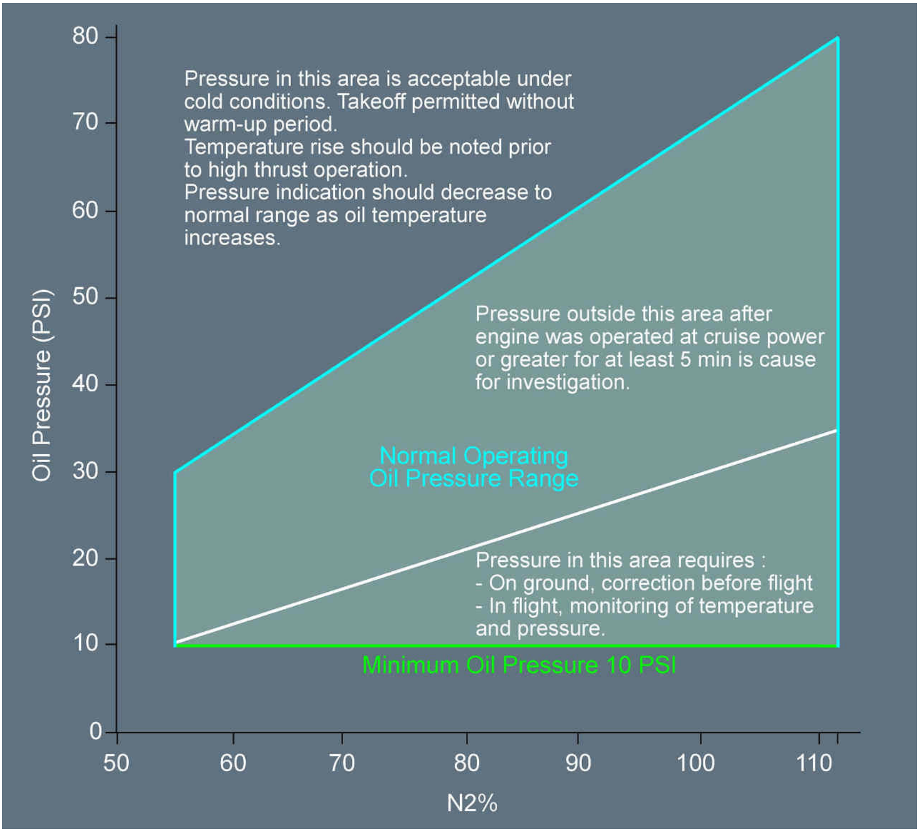
OIL QUANTITY

Minimum oil quantity.. 12 qt + estimated consumption

- *Average estimated consumption = 0.56 qt/h,*
- *Engine operation with engine oil consumption above 0.56 qt/h and up to 0.87 qt/h is allowed, provided that the engine oil consumption enables fulfillment of the mission.*

OIL PRESSURE

MIN/MAX Oil Pressure (ECAM Indication)



STARTER

Ident.: LIM-ENG-00001866.0003001 / 04 JUN 19
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

- A standard automatic start that includes up to three start attempts, is considered one cycle
- For ground starts (automatic or manual), a 30 s pause per minute of operation is required between successive cycles
- A 10 min cooling period is required, subsequent to two failed cycles, before each subsequent cycle
- The starter must not be run when N2 is above 30 %

STARTER

Ident.: LIM-ENG-00001866.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

- Starter maximum continuous operation is 5 min .
- Two 3 min duty cycles and a consecutive 1 min cycle is permitted with run down to zero N3 between each cycle.
- After one continuous operation, or the three cycles wait 30 min to allow the starter to cool.
- No running engagement of the starter when the N3 is above 10 % on ground, or 30 % in flight.

REVERSE THRUST

Ident.: LIM-ENG-00020229.0001001 / 17 MAR 17
Applicable to: ALL

Selection of the reverse thrust is prohibited in flight.
Backing the aircraft with reverse thrust is not permitted.
Maximum reverse should not be used below 70 kt. Idle reverse is permitted down to aircraft stop.

REDUCED THRUST TAKEOFF

Ident.: LIM-ENG-10-00020230.0013001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 60 °C.
- Lower than the flat rating temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020230.0002001 / 17 MAR 17
Applicable to: LV-GKO, LV-GKP, LV-KAN, LV-KAO

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 43 °C.
- Lower than the flat rating temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020230.0005001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 72 °C.
- Lower than the flat rating temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020231.0001001 / 17 MAR 17
Applicable to: ALL

DERATED TAKEOFF

Selection of TOGA thrust is not permitted when a derated takeoff is performed, except when requested in any abnormal or emergency procedures.

The use of reduced thrust takeoff (FLEX takeoff) is not permitted in association with derated takeoff.
The use of derated takeoff is permitted regardless of the runway condition (dry, wet, or contaminated).

CROSSWIND OPERATION ON GROUND

Ident.: LIM-ENG-00020232.0002001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

Engine crosswind limit at takeoff.. 32 kt (gust included)

SOFT GO-AROUND ◁

Ident.: LIM-ENG-00020233.0001001 / 17 MAR 17
Applicable to: ALL

The use of soft go-around is prohibited with one engine inoperative.

FUEL

PRELIMINARY PAGES - TABLE OF CONTENTS

Certified Fuel....................A
Fuel Temperature....................B
Maximum Allowed Fuel Imbalance....................C
Minimum Fuel Quantity for Takeoff....................D

Intentionally left blank

CERTIFIED FUEL

Ident.: LIM-FUEL-00019828.0003001 / 24 OCT 17
Applicable to: ALL

The fuel system is certified with: JET A, JET A1, JET B, JP4, JP5, JP8, N°3 JET, RT and TS-1, in accordance with engine manufacturers and fuel specifications.

Note: *The fuel system has been certified with JET B and JP4, provided that the trim tank is empty and isolated during the entire flight.*

FUEL TEMPERATURE

Ident.: LIM-FUEL-00019837.0003001 / 28 NOV 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Maximum fuel temperature	:	JET A, JET A1, JP5, JP8, N°3 JET, RT, and TS-1: +55 °C JP4, JET B: +49 °C
Minimum fuel temperature	:	The highest of freezing point +3 °C or -54 °C, in inner tank. Freezing point in outer or trim tank.

If the actual fuel freezing point of the fuel that is used for the flight is not identified, the fuel specification freezing point provided as follows must be used:

JET A	JET A1	JP5	JP8	N°3 JET	TS-1	RT	JP4	JET B
-40 °C	-47 °C	-46 °C	-47 °C	-47 °C	-50 °C	-50 °C	-58 °C	-50 °C

Note: *The various types of fuel can be mixed in all proportions. However, in the case of fuel mixture, the minimum fuel specification values provided in the table above are no longer applicable.*

FUEL TEMPERATURE

Ident.: LIM-FUEL-00019837.0004001 / 28 NOV 17
Applicable to: LV-KHT, LV-KHU

Maximum fuel temperature	:	JET A, JET A1, JP5, JP8, N°3 JET, RT, and TS-1: +55 °C JP4, JET B : +49 °C
Minimum fuel temperature	:	The highest of freezing point or -44 °C below 30 000 ft or -54 °C above 30 000 ft, in inner tank. Freezing point in outer or trim tank.

If the actual fuel freezing point of the fuel that is used for the flight is not identified, the fuel specification freezing point provided as follows must be used:

JET A	JET A1	JP5	JP8	N°3 JET	TS-1	RT	JP4	JET B
-40 °C	-47 °C	-46 °C	-47 °C	-47 °C	-50 °C	-50 °C	-58 °C	-50 °C

Note: *The various types of fuel can be mixed in all proportions. However, in the case of fuel mixture, the minimum fuel specification values provided in the table above are no longer applicable.*

MAXIMUM ALLOWED FUEL IMBALANCE

Ident.: LIM-FUEL-00019833.0001001 / 17 MAR 17
Applicable to: ALL

The following table indicates the maximum allowed wing imbalance at takeoff, in flight, and at landing.

INNER TANKS (OUTER BALANCED)		OUTER TANKS (INNER BALANCED)	
Tank Fuel Quantity (Heavier Tank)	**Maximum Asymmetry**	**Tank Fuel Quantity (Heavier Tank)**	**Maximum Asymmetry**
Full	2 900 kg (6 393 lb)	Full	1 480 kg (3 261 lb)
17 000 kg (37 478 lb)	4 800 kg (10 582 lb)	2 400 kg (5 290 lb)	1 580 kg (3 482 lb)
7 500 kg (16 534 lb)	7 500 kg (16 534 lb)	1 730 kg (3 812 lb)	1 730 kg (3 812 lb)

The variation is linear between these values, and there is no limitation below 7 500 kg (16 534 lb) for inner tanks and 1 730 kg (3 812 lb) for outer tanks.

Note: *In exceptional conditions (i.e. fuel system failure), the above-mentioned values for maximum fuel imbalance may be exceeded without significant effect to the aircraft handling qualities. The aircraft remains fully controllable in all flight phases.*

Note: *For asymmetrically loaded cargo (A330-200F only), refer to the Weight and Balance Manual.*

MINIMUM FUEL QUANTITY FOR TAKEOFF

Ident.: LIM-FUEL-00019840.0003001 / 17 MAR 17
Applicable to: ALL

Minimum fuel quantity for takeoff..5 200 kg (11 461 lb)
The ECAM alerts that are related to fuel low level in the wing tanks (FUEL WING TK LO LVL, etc.) must not appear for takeoff.

ICE AND RAIN PROTECTION

Intentionally left blank

Definition of Icing Conditions....A
Definition of Severe Ice Accretion....B
Definition of Thin Hoarfrost....C
Rain Repellent ....D
Wipers Maximum Operating Speed....E

Intentionally left blank

DEFINITION OF ICING CONDITIONS

Ident.: LIM-ICE_RAIN-00020420.0001001 / 12 JUL 18
Applicable to: ALL

- Icing conditions exist when the OAT (on ground or after takeoff) or the TAT (in flight) is at or below 10 °C and visible moisture in any form is present (such as clouds, fog with visibility of 1 sm (1 600 m) or less, rain, snow, sleet or ice crystals).
- Icing conditions also exist when the OAT on the ground and for takeoff is at or below 10 °C and operating on ramps, taxiways or runways where surface snow, standing water or slush may be ingested by the engines, or freeze on engines, nacelles or engine sensor probes.

DEFINITION OF SEVERE ICE ACCRETION

Ident.: LIM-ICE_RAIN-00020421.0001001 / 20 MAR 17
Applicable to: ALL

Ice accretion is considered severe when the ice accumulation on the airframe reaches approximately 5 mm (0.2 in) thick or more.

DEFINITION OF THIN HOARFROST

Ident.: LIM-ICE_RAIN-00020422.0001001 / 20 MAR 17
Applicable to: ALL

Thin hoarfrost is typically a white crystalline deposit which usually develops uniformly on exposed surfaces on cold and cloudless nights.
It is so thin that surface features (lines or markings) can be distinguished beneath it.

RAIN REPELLENT

Ident.: LIM-ICE_RAIN-00020129.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew should only use the rain repellent in the case of moderate to heavy rain.

WIPERS MAXIMUM OPERATING SPEED

Ident.: LIM-ICE_RAIN-00020130.0001001 / 17 MAR 17
Applicable to: ALL

Intentionally left blank

BRAKING SYSTEM

Ident.: LIM-LG-00020191.0001001 / 17 MAR 17
Applicable to: ALL

The braking system is not designed to hold the aircraft in a stationary position when a high thrust level is applied on at least one engine.
During ground procedures that require a thrust increase with braking, the flight crew must ensure that the aircraft remains stationary, and must be ready to immediately retard the thrust levers to IDLE.

BRAKE TEMPERATURE

Ident.: LIM-LG-00020192.0001001 / 17 MAR 17
Applicable to: ALL

Maximum brake temperature for takeoff (brake fans ◁* off)..300 °C

MAXIMUM SPEEDS WITH THE LANDING GEAR EXTENDED

Ident.: LIM-LG-00020195.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Speeds with the Landing Gear Extended.

MAXIMUM TIRE SPEED

Ident.: LIM-LG-00020196.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Tire Speed.

NOSEWHEEL STEERING (NWS)

Applicable to: ALL

Ident.: LIM-LG-10-00020205.0001001 / 17 MAR 17

For NWS angle limit, *Refer to DSC-20-30 Taxiing*.

Ident.: LIM-LG-10-00020206.0002001 / 17 MAR 17

Braked pivot turn is prohibited (ie. differential braking cannot be used to fully stop one main gear).

Ident.: LIM-LG-10-00020207.0001001 / 17 MAR 17

Asymmetric thrust should be used during the turn, to maintain a continuous speed (between 5 and 10 kt). Some anticipation is required to ensure that asymmetric thrust is available at the beginning of the turn.

Ident.: LIM-LG-10-00020208.0001001 / 17 MAR 17

Towbarless operation on the nose landing gear (towing and pushback) is approved when using the accepted towbarless towing vehicles listed in the Airbus WISE ISI 09.11.00001.

TAXI WITH DEFLATED OR DAMAGED TIRES

Ident.: LIM-LG-00020194.0001001 / 04 DEC 18
Applicable to: ALL

To vacate the runway or taxi at low speed with tire(s) deflated (not damaged), all of the following limitations apply:

- If maximum one tire per gear is deflated (consider three gears)
  Maximum taxi speed during turn............ 7 kt
- If two tires are deflated on the same main gear (maximum one main gear)
  Maximum taxi speed............ 3 kt
  Maximum NWS angle............ 30 °

In addition, if tire damage is suspected, the flight crew must ask for an aircraft inspection prior to vacate the runway or taxi. If the ground crew suspects that a tire burst may damage the landing gear, maintenance action is due.
For more information, *Refer to FCTM/PR-AEP-LG Taxi with Deflated or Damaged Tires*.

Inertial Reference System (IRS)........A

Intentionally left blank

INERTIAL REFERENCE SYSTEM (IRS)

Ident.: LIM-NAV-00020158.0001001 / 30 AUG 18
Applicable to: ALL

IR GROUND ALIGNMENT

IR alignment in NAV mode is possible on ground only. Ground alignment of the IRS is possible in latitudes between 82 ° North and 82 ° South.

MAGNETIC (MAG) / TRUE REFERENCE

- **If all ADIRUs have the same magnetic variation table:**

  In NAV mode, the IR will not provide valid magnetic heading and magnetic track angle:
  - North of 73 ° North, between 90 ° West and 120 ° West (magnetic polar region)
  - North of 82 ° North
  - South of 60 ° South.

  When flying at latitudes beyond these limits, the TRUE reference must be selected.

- **If one ADIRU has a different magnetic variation table:**

  In NAV mode, the IR will not provide valid magnetic heading and magnetic track angle:
  - North of 60 ° North, between 30 ° West and 160 ° West
  - North of 75 ° North
  - South of 55 ° South.

  Flying at latitudes beyond these limits is prohibited.

(1) *REF Temperature:*
- *On ground : REF Temperature = (OAT + Cockpit TEMP) / 2*
- *In flight : REF Temperature = CAB TEMP (°C) - 10 °C, or*
  REF Temperature = CAB TEMP (°F) - 18 °F

(2) *Minimum Bottle Pressure to Cover:*
- *Preflight checks*
- *The use of oxygen, when only one flight crewmember is in the cockpit*
- *Unusable quantity (to ensure regulator operation with minimum pressure)*
- *Normal system leakage*
- *The most demanding case among the following:*
  - *Protection after loss of cabin pressure with mask regulator on NORMAL (diluted oxygen):*
    - *During emergency descent for all flight crewmembers and observers for 15 min*
    - *During cruise at FL 100 for two crewmembers for 105 min.*
  - *Protection against smoke with 100 % oxygen for all flight crewmembers and observers during 15 min at 8 000 ft cabin altitude.*

Note: The above times that are based on the use of a sealed mask may be shorter for bearded crew (in terms of performance, pressure, or duration).

MINIMUM FLIGHT CREW OXYGEN PRESSURE

ROW/ROP

Ident.: LIM-ROW_ROP-00016118.0001001 / 30 JUN 20
Applicable to: LV-GHQ, LV-GIF, LV-KAN, LV-KAO

In the case of runways not validated for ROPS in the GPWS database, ROPS is inoperative. It is the operator's responsibility to inform the flight crews about the runways that are not validated for ROPS, along the scheduled route.

The ROPS may be inhibited (TERR pb set to OFF on GPWS panel) when the aircraft position is less than 15 nm from the airfield:
- For specific approach procedures which have previously been identified as potentially producing undue ROW alerts.
- If a NOTAM displaces the landing threshold (shortened LDA).

Operations where the ROW alert landing distance is greater than the LDA must not be conducted unless a specific authorization is obtained from the appropriate authority. For these runways, ROW alerts may be triggered if ROPS is not inhibited (on the GPWS panel, the TERR pb is kept ON).
In the case of a failure that affects landing performance and/or the availability of the thrust reversers, ROPS does not prevent runway excursion.
In any case, if ROPS alerts are triggered, the flight crew must immediately apply the ROPS procedures.

Intentionally left blank

GPWS / PREDICTIVE GPWS ◁

Ident.: LIM-SURV-00019862.0001001 / 26 NOV 19
Applicable to: ALL

Aircraft navigation must not be based on the use of the terrain display.
The terrain display is intended to serve as a situation awareness tool only, and may not provide the accuracy on which to solely base terrain avoidance maneuvering.

The predictive GPWS ◁ functions should be inhibited (TERR pushbutton to OFF, on the GPWS panel) when the aircraft position is less than 15 NM from the airfield :
- For operations from/to runways not incorporated in the predictive GPWS database.
- For specific approach or departure procedures, which have previously been identified by the operator as potentially causing expected or spurious terrain alerts.

Note: *The decision to inhibit the predictive GPWS ◁ functions must not be based on flight crew judgement only.*

Only aircraft with Man-made Obstacle Function ◁ can display obstacles on ND and trigger alerts, based on a dedicated database which includes artificial obstacles worldwide.

Applicable to: LV-KHT, LV-KHU

In case of no EPR available, the thrust control automatically reverts to N1 mode (rated or degraded).
Refer to PRO-ABN-ENG ENG 1(2) EPR MODE FAULT
If the rated N1 mode is lost on all engines, refer to the power management tables given on the following tables.
The herebelow table gives the N1 to be set in cruise to maintain M 0.82

EFB-TOF-50 Takeoff Recommendations

Takeoff Recommendations....................A

GENERAL

Ident.: EFB-TOF-10-00022661.0001001 / 02 OCT 19
Applicable to: ALL

The takeoff performance optimization is the process which aims at obtaining:
- The maximum performance limited takeoff weight (MTOW (perf))
- The optimum takeoff thrust for a given weight.

The takeoff performance is optimized for a given runway, the associated obstacles, the flaps setting, the prevailing outside conditions (temperature, wind, and QNH) and the aircraft status.

The takeoff performance optimization process:
- Takes into account the parameters that affect takeoff performance
- Optimizes the parameters for which there is a possible range of values or settings

L2 The takeoff performance optimization process is made with the takeoff performance (T.O PERF) application.

TAKEOFF PARAMETERS

Ident.: EFB-TOF-10-00022662.0001001 / 03 NOV 23
Applicable to: ALL

The takeoff performance parameters are:

- The characteristics of the runway:
  - L2 Declared lengths (TORA, TODA, ASDA)
  - Elevation
  - Slope
  - Obstacles.
- L1 The regulatory requirements
- The line up distances as applicable
- The outside conditions:
  - L2 OAT
  - Wind

    Maximum tailwind is limited to a certified value. There is no maximum certified value for headwind, however a headwind higher than 40 kt results in no additional performance credit.
    In accordance with regulation, the computation is based on 150 % of the entered tailwind, and 50 % of the entered headwind.
    A maximum crosswind component is associated with each runway condition.
    For more information on crosswind limitations, *Refer to LIM-AG-OPS Crosswind Takeoff and Landing*.
    In addition, the flight crew applies a different thrust setting technique during the takeoff procedure:

    - In the case of tailwind, or
    - When the crosswind component exceeds a threshold value that may affect the calculation of the takeoff distance depending on the engine model installed on the aircraft.

    For more information on the takeoff procedure, *Refer to PRO-NOR-SOP-12 Takeoff - Thrust Setting*.
  - QNH
  - Runway condition.
- L1 The aircraft configuration:
  - L2 Aerodynamic configuration
  - Air conditioning setting
  - Anti-ice selection
  - Thrust setting.
- L1 The aircraft status:

L2
- MEL items
- CDL items.

L1 - The takeoff speeds:

L2
- V1
- VR
- V2.

L1 The following parameters can be optimized:

- Aerodynamic configuration
- Air conditioning
- Thrust setting:

L2
- TOGA
- FLEX
- Derate levels.

L1 - Takeoff speeds.

L2 From the takeoff performance parameters that can be optimized, the takeoff speeds optimization has the largest effect on the gain of takeoff weight. The range for optimization varies from 0.84 to 1.0 for V1/VR ratio and from 1.13 to 1.4 for V2/VS1G ratio.

Intentionally left blank

TOGA THRUST

Ident.: EFB-TOF-20-10-00022663.0001001 / 02 OCT 19
Applicable to: ALL

TOGA is the maximum thrust certified for takeoff.
When all engines are operative, the TOGA thrust rating must not be used more than 5 min.
In the case of one engine out, the TOGA thrust rating may be used for a maximum of 10 min.

The flight crew must use TOGA thrust for takeoff if at least one of the following conditions applies:
- Maximum power is required
- Performance reasons
- Flexible takeoff and derated takeoff are not permitted.

Intentionally left blank

General

GENERAL

Ident.: EFB-TOF-20-20-10-00022664.0001001 / 02 OCT 19
Applicable to: ALL

The actual takeoff weight of the aircraft is often lower than the maximum regulatory takeoff weight. In this case, it may be possible to takeoff at a thrust less than the maximum takeoff thrust. This allows to increase the engine life, improve the engine reliability and reduce the maintenance costs.

Two categories of takeoff at reduced thrust exist:
- The use of flexible temperature concept referred to as flexible takeoff
- The use of a fixed derated thrust level referred to as derated takeoff.

Intentionally left blank

Flexible Takeoff

FLEXIBLE TAKEOFF DEFINITION

Ident.: EFB-TOF-20-20-20-00022665.0001001 / 02 OCT 19
Applicable to: ALL

When the actual takeoff weight is lower than the maximum performance limited takeoff weight, the aircraft may comply with the regulatory requirements with a reduced thrust, called flexible takeoff thrust.
This takeoff operation is the FLEX takeoff.

FLEXIBLE TAKEOFF PRINCIPLE

Ident.: EFB-TOF-20-20-20-00022666.0001001 / 02 OCT 19
Applicable to: ALL

The FLEX takeoff principle is based on the change in maximum available thrust with OAT.
The maximum performance limited takeoff weight depends on the maximum available takeoff thrust, therefore it is possible to determine a temperature at which the actual takeoff weight would be limited by performance.
This temperature is referred to as TFLEX (Flex Temperature).

FLEXIBLE TAKEOFF LIMITATIONS

Ident.: EFB-TOF-20-20-20-00022667.0018001 / 05 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

Takeoff at reduced thrust, so-called as FLEX takeoff, is allowed only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).

TFLEX cannot be:
- Higher than TMAXFLEX
L2 For more information on TMAXFLEX, *Refer to LIM-ENG Flex Takeoff*.
- L1 Lower than the flat rating temperature (TREF)
- Lower than the actual OAT.

Derated Takeoff (If Installed)

DERATED TAKEOFF DEFINITION

Ident.: EFB-TOF-20-20-30-00022668.0001001 / 02 OCT 19
Applicable to: ALL

A derated takeoff is defined as the takeoff operation at a thrust setting lower than TOGA, for which the AFM provides a set of takeoff limitations and performance data.
The N1/EPR values corresponding to each derated takeoff thrust setting are given in the AFM and are considered as a normal takeoff limit.
Six derate levels are defined:
D04, D08, D12, D16, D20 and D24, corresponding to 4, 8, 12, 16, 20 and 24 % decrease from the maximum takeoff thrust.

DERATED TAKEOFF PRINCIPLE

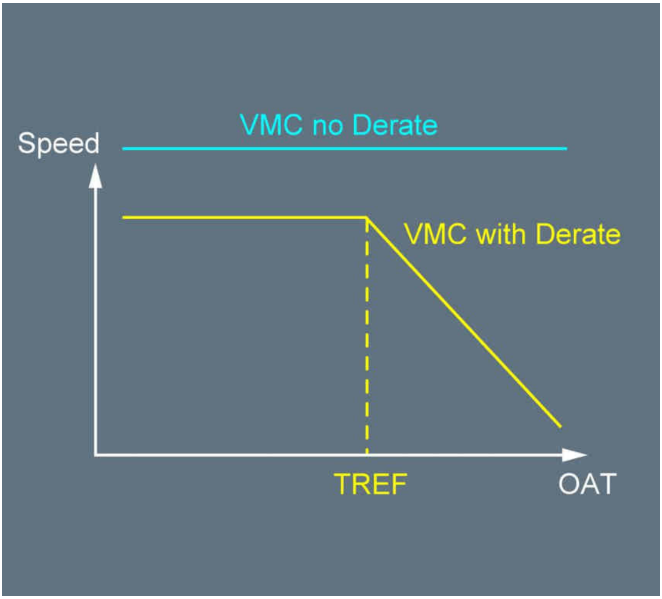
Ident.: EFB-TOF-20-20-30-00022669.0001001 / 02 OCT 19
Applicable to: ALL

The derated takeoff enables to improve the takeoff performance if the TOW is limited by VMCG. VMCG limitation usually occurs on short and/or contaminated runways. The principle is to impose a lower engine rating to benefit from lower minimum control speeds.

L2 In the case of derated takeoff, the minimum control speeds (VMCG and VMCA) are decreased because:

- The derated thrust is lower than the maximum takeoff thrust
- The effect of temperature on maximum available thrust is taken into account.

Derated Takeoff Principle



VMCG LIMITING

VMCG only has an impact on the ASD that includes an acceleration and a deceleration phase. The decrease in VMCG allows to use lower V1 values in the speed optimization, which shortens both the acceleration and the deceleration distances.

The weight decrement linked to the derated thrust is largely compensated by the benefit of shorter ASD. As a consequence, if takeoff performance is limited by the VMCG limited weight, an overall improvement can be achieved by derating.

VMCA LIMITING

The penalizing effect on climb gradient of the decrease in thrust outweighs the advantage of a lower VMCA.
Therefore derated takeoff would not improve the takeoff weight if VMCA limited.

DERATED TAKEOFF LIMITATIONS

Ident.: EFB-TOF-20-20-30-00022670.0001001 / 02 OCT 19
Applicable to: ALL

It is not permitted to combine a derated takeoff and a FLEX takeoff.
When a derated takeoff is performed, the selection of full takeoff thrust, by setting thrust levers to TOGA, is not permitted below the speeds specified in the "Engine Failure After V1 - Continued Takeoff Operating Technique". The only exception is the Recovery Technique at takeoff after the penetration of unforecast windshear.
L2 For more information on the specified speeds, *Refer to FCTM/PR-AEP-ENG Engine Failure after V1*.

DESCRIPTION

Ident.: EFB-TOF-30-10-00022674.0001001 / 28 MAY 20
Applicable to: ALL

A runway is dry when its surface is:
- Free of visible moisture
- Not contaminated.

PERFORMANCE CALCULATION

Ident.: EFB-TOF-30-10-00022675.0001001 / 02 OCT 19
Applicable to: ALL

Takeoff performance is calculated without the benefit of thrust reversers, as per regulation. Flexible takeoff and derated takeoff are allowed for a takeoff from a dry runway.

Intentionally left blank

DESCRIPTIONS

Ident.: EFB-TOF-30-20-00022676.0001001 / 15 NOV 21
Applicable to: ALL

WET RUNWAY

A runway is considered as wet, when the surface is covered by any visible moisture or water up to and including 3 mm (1/8 in) depth. When the water film does not exceed 3 mm (1/8 in), there is no significant danger of hydroplaning.

Note: 1. *A damp runway is considered wet, regardless of whether or not the surface has a shiny appearance.*
2. *A runway is considered slippery wet when a significant portion of its surface does not comply with the applicable minimum friction criteria.*

PERFORMANCE CALCULATION

Ident.: EFB-TOF-30-20-00022677.0001001 / 15 NOV 21
Applicable to: ALL

Takeoff performance on a wet runway can be calculated with the benefit of thrust reversers.
However, it is not allowed to take off at a weight higher than the weight on dry runway.
Flexible takeoff and derated takeoff are allowed for a takeoff from a wet runway.

L2 For information on contaminants equivalent to wet runway, *Refer to EFB-TOF-30-30 Performance Calculation*.

L1 For runways that have portions declared as slippery wet, performance should be calculated with the Slippery wet runway condition option, or, if not available, Dry snow 10 mm (2/5").

Note: *Flexible takeoff computation is not available for Dry snow 10 mm (2/5").*

Intentionally left blank

DESCRIPTIONS

Ident.: EFB-TOF-30-30-00022678.0001001 / 15 NOV 21
Applicable to: ALL

A runway is contaminated when a significant portion (depending on the applicable regulation) of its surface is covered with:
- A layer of fluid contaminant not considered as thin
- A hard contaminant.

FLUID CONTAMINANT

In terms of performance, a contaminated runway is a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8 in). The fluid contaminant can be either:
- Dry snow
- Wet snow
- Standing water
- Slush.

Fluid Contaminants reduce friction forces, and cause:
- Precipitation drag
- Hydroplaning.

L2 Fluid contaminants descriptions:
- Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
- Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
- Standing water occurs due to heavy rain and/or not sufficient runway drainage. Standing water has a depth of more than 3 mm (1/8 in).
- Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures of approximately 5 °C, and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).

L1 HARD CONTAMINANT

In terms of performance, a contaminated runway is a runway covered by a hard contaminant that can be either:
- Compacted snow
- Ice (Cold and Dry)
- Wet ice.

Hard contaminants only reduce friction forces.

L2 Hard contaminants descriptions:

- Compacted snow: the maintenance personnel use a snow groomer to compress the snow on a runway in order to obtain a hard surface
- Ice (Cold and Dry): situation in which ice occurs on the runway in cold and dry conditions
- Wet ice: when the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

PERFORMANCE CALCULATION

Ident.: EFB-TOF-30-30-00022679.0001001 / 03 NOV 23
Applicable to: ALL

Takeoff performance on contaminated runways can be calculated with the benefit of thrust reversers. However, it is not allowed to take off at a weight higher than the weight on a dry runway.

For fluid contaminants, takeoff performance data are provided up to the following depths:
- Dry snow: 100 mm (4 in)
- Wet snow: 20 mm (4/5 in)
- Standing water: 13 mm (1/2 in)
- Slush: 13 mm (1/2 in).

Performance computations for depths above the real depth of contamination on the runway may provide results that are better than the real aircraft performance, because of the excess drag that improves the stopping distance. Airbus recommends to retain the takeoff speeds and thrust setting of the lower MTOW (perf) resulting from two computations: one with the depth above the reported depth and one with the depth below.

Note: *The Airbus EFB TAKEOFF PERF application automatically makes this double computation.*

L2 The following assumptions are considered for the calculation:
- The contaminant covers the entire length of the runway in a layer that has a uniform depth and density
- The friction coefficient is based on studies, and verified by tests
- The screen height at the end of the takeoff segment is 15 ft, instead of 35 ft.

L1 Derated takeoff is allowed on contaminated runways.

EQUIVALENCES

In terms of performance:
- A fluid contamination is equivalent to wet, up to a maximum depth of 3 mm (1/8 in) of:
  - Dry snow
  - Wet snow
  - Standing water
  - Slush.
- Frost is equivalent to wet, unless a lower runway performance code is reported
- Compacted snow with OAT above -15 °C is equivalent to Dry snow 10 mm (2/5 in)

  Note: *Compacted snow is appropriate for OAT at or below -15 °C.*

- Dry snow over compacted snow is equivalent to dry snow of appropriate depth
- Wet snow over compacted snow is equivalent to wet snow of appropriate depth.

DOWNGRADE

- **If both the runway condition and the RWYCC inputs are available in the T.O PERF application:**
  The flight crew enters both the downgraded RWYCC and the runway condition to perform the takeoff computation.
- **If only the runway condition is available in the T.O PERF application:**
  - **For a runway covered by a hard contaminant, or a fluid contaminant with a depth of 3 mm (1/8 in) or less:**

    In the case of a downgrade to:
    - RWYCC 4, the flight crew computes the takeoff performance with Compacted snow
    - RWYCC 3, the flight crew computes the takeoff performance with Dry snow 10 mm (2/5 in)
    - RWYCC 2, the computation with any depth of Slush or Standing water may not be conservative. The flight crew should delay the takeoff, or compute the takeoff performance with Ice cold & dry
    - RWYCC 1, the flight crew computes the takeoff performance with Ice cold & dry.
  - **For a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8 in):**
    In the case of any downgrade, the flight crew should delay the takeoff.

RESTRICTIONS

Ident.: EFB-TOF-30-30-00022680.0001001 / 02 OCT 19
Applicable to: ALL

FLEX takeoff is not permitted on contaminated runways.
Dispatch from a runway covered with wet ice is not permitted, unless a specific method for performance assessment has been established by the operator.
Refer to the AFM for further guidance.

TAKEOFF WITH MEL OR CDL ITEM

Ident.: EFB-TOF-40-00022673.0001001 / 02 OCT 19
Applicable to: ALL

The aircraft can be dispatched with deferred MEL or CDL items.

MEL or CDL items that affect takeoff performance are:
- MEL items that reduce braking capabilities (brakes, spoilers, thrust reversers)
- MEL items that have an effect on thrust available (engine anti-ice valve stuck open)
- MEL items that may lead to a reduced systems efficiency (rudder actuator, DFS, EDP)
- CDL items that increase aircraft drag (seals, fairings).

L2 CDL items are divided in two categories: negligible and non-negligible items.
If the number of negligible CDL items is less or equal to three, no penalty applies.
If the number of negligible CDL items is more than three, a drag increase for each item is applied.

Intentionally left blank

TAKEOFF RECOMMENDATIONS

Ident.: EFB-TOF-50-00022672.0001001 / 02 OCT 19
Applicable to: ALL

TAKEOFF CONFIGURATION

As a general rule, CONF 1+F gives better performance on long runways (better climb gradient), whereas CONF 3 gives better performance on short runways (shorter takeoff distances). Sometimes, other parameters, such as obstacles can interfere. In this case, a compromise between climb and runway performance is requested, making CONF 2 the optimum configuration for takeoff.
Environmental takeoff conditions may also impact the choice of the takeoff configuration.
The following takeoff configuration is then recommended:

OUTSIDE CONDITIONS	FLAPS SETTINGS	OBJECTIVE
Dry or wet, well-paved runway	Use the flaps setting that provides the optimum performance. If takeoff weight is not limited by performance, consider using the higher flaps setting. *Note:* *Corresponds to OPT CONF selection in T.O PERF*	To extend engine life and save maintenance costs
High altitude takeoff	Use CONF 2 or CONF 3	To improve comfort
Badly-paved runway, or accelerate stop distance limited runway	Use CONF 2 or CONF 3	To improve comfort and stopping distance

FLEXIBLE TAKEOFF

Flexible takeoff is the recommended method for takeoff at reduced thrust on dry and wet runways. The highest flexible temperature (TFLEX) extends engine life and saves maintenance costs. However, if a high TFLEX is reduced by a few degrees only, the engines are not significantly affected.
The highest TFLEX will usually be obtained at the lowest flap setting. However, a higher flaps setting provides a lower decision speed (V1) and more comfort.
To extend engine life and to save maintenance costs, the use of flaps setting that provides the highest TFLEX is recommended. However, when the difference (in terms of TFLEX) between two configurations is low, the highest of both takeoff configurations is preferable.

IN-FLIGHT PERFORMANCE CALCULATION

Ident.: EFB-IFT-10-00022807.0001001 / 02 OCT 19
Applicable to: ALL

Performance data are split by flight phases: climb, cruise, descent, and holding.
In-flight performance calculation is made with the in-flight performance application (IN-FLT PERF).

Intentionally left blank

General

GENERAL

Ident.: EFB-IFT-20-10-10-00022808.0002001 / 02 OCT 19
Applicable to: ALL

The climb phase starts at the end of takeoff and ends at the initial cruise level.

The available thrust options are:
- DCL: derated climb
- CLB: maximum climb thrust.

Intentionally left blank

Climb Thrusts

DERATED CLIMB THRUST

Ident.: EFB-IFT-20-10-20-00022809.0001001 / 02 OCT 19
Applicable to: ALL

Derated Climb (DCLB) offers the following economical advantages:
- Increased engine life
- Improved engine reliability
- Reduced direct maintenance costs.

There are two derated climb levels: Derated Climb 1 (DCLB1) and Derated Climb 2 (DCLB2).
The advantages increase, when derate climb levels are high (DCLB2). The disadvantages (i.e. a slight increase in fuel and time) are usually counterbalanced by reduced maintenance costs.
The flight crew must select the applicable derated climb level before takeoff. Airbus recommends that, when possible, DCLB2 be selected. However, operational constraints may require higher thrust levels, and it may not be possible to achieve such thrust levels when DCLB2 is selected. If this is the case, the flight crew should perform the climb with DCLB1 and, if required, with Maximum Climb (MCL).

MAXIMUM CLIMB THRUST

Ident.: EFB-IFT-20-10-20-00022810.0001001 / 02 OCT 19
Applicable to: ALL

The “Maximum Climb” thrust rating is the maximum thrust approved for normal climb.
The FADEC commands this rating when the thrust lever is on the CL detent and the flight crew has selected CLB in the CLB THR list of the FMS ACTIVE/PERF page.

Intentionally left blank

Speeds

ECONOMIC MACH NUMBER (ECON MACH)

Ident.: EFB-IFT-20-20-10-00022811.0001001 / 02 OCT 19
Applicable to: ALL

COST INDEX

The Cost index (CI) is defined as the ratio between Cost of Time per time unit (CT) and Cost of Fuel per mass unit (CF).
The CI value is expressed in kilograms per minute (kg/min), or hundreds of pounds per hour (100 lbs/hr).
The purpose of the CI concept is to reduce Direct Operating Costs (DOC).

ECON MACH

For a given CI, ECON Mach is defined as the Mach for which DOC are minimum.

LONG RANGE CRUISE SPEED (LRC)

Ident.: EFB-IFT-20-20-10-00022812.0001001 / 02 OCT 19
Applicable to: ALL

The Long Range Cruise speed (LRC) is defined as the Mach number for which the specific range is equal to 99 % of the maximum specific range.
L2 For more information, *Refer to DSC-22_20-40-20 Cost Index (CI)*.

FIXED SPEED

Ident.: EFB-IFT-20-20-10-00022813.0001001 / 02 OCT 19
Applicable to: ALL

The fixed speed is either a Mach or a CAS.

TURBULENCE SPEED

Ident.: EFB-IFT-20-20-10-00022814.0001001 / 02 OCT 19
Applicable to: ALL

Turbulence speeds are recommended when the aircraft flies in a turbulent atmosphere.
For recommended turbulence speed, *Refer to PRO-ABN-MISC [QRH] General*.

MAXIMUM SPEED

Ident.: EFB-IFT-20-20-10-00022815.0001001 / 02 OCT 19
Applicable to: ALL

Maximum speed is either:
- The Maximum Operating Mach (MMO), or
- The Maximum Operating speed (VMO), or
- The speed limited by the available thrust.

L2 For more information on Maximum Speed, *Refer to LIM-AG-SPD Maximum Operating Speed VMO/MMO*.

Altitude/Ceilings

DEFINITIONS

Ident.: EFB-IFT-20-20-20-00022816.0001001 / 02 OCT 19
Applicable to: ALL

OPTIMUM ALTITUDE

The optimum altitude (OPT ALT) is the altitude at which the SR is maximum.

REC MAX

Maximum altitude is defined as the lower of:
- Maximum altitude at maximum cruise thrust in level flight
- Maximum altitude at maximum climb thrust with 300 ft/min vertical speed
- Maximum certified altitude
- 1.3 g buffet limited altitude.

ALTITUDE OPTIMIZATION

Ident.: EFB-IFT-20-20-20-00022817.0001001 / 02 OCT 19
Applicable to: ALL

The optimum altitude definition depends on the cruise type.
The optimum altitude (OPT) displayed on the FMS-PERF page and the optimum altitude (OPTIMUM ALT) determined by the EFB IN-FLT PERF Cruise computation for a given Cost Index (CI) are the result of a minimum cost analysis. To determine these optimum altitudes, both the FMS and IN-FLT PERF calculate the value of the Cost Function (CF) based on the CI. The altitude that provides the lowest value for the CF is displayed as OPT on the FMS-PERF page and as OPTIMUM ALT on the EFB IN-FLT PERF.
These optimum altitude computations take into account a large number of parameters. The FMS and the EFB consider some of these parameters in a different manner. Therefore, OPT on the FMS and OPTIMUM ALT on the EFB may differ.
L2 The main contributor to any difference between OPT on the FMS and OPTIMUM ALT on the EFB is the wind.

Intentionally left blank

GENERAL

Ident.: EFB-IFT-20-30-00022818.0001001 / 02 OCT 19
Applicable to: ALL

The descent phase starts at the top of descent and ends at landing or level off.
In the case of an emergency descent, MMO/VMO is the best speed profile as it gives high rate of descent, which can be increased by extending the speed brakes, if needed.

Intentionally left blank

GENERAL

Ident.: EFB-IFT-20-40-00022819.0001001 / 02 OCT 19
Applicable to: ALL

The holding phase, when required, starts before the landing phase above the destination or alternate airport.
In CONF CLEAN, the standard holding speed is the Green dot, as it is a good approximation of the maximum endurance speed.

Intentionally left blank

ONE ENGINE INOPERATIVE STRATEGIES

Ident.: EFB-IFT-30-00022821.0001001 / 02 OCT 19

LONG RANGE CRUISE SPEED

Ident.: EFB-IFT-30-00022822.0001001 / 02 OCT 19
Applicable to: ALL

If the EO mode of the FMS is active, the FMS takes the engine failure into account to compute the EO-LRC speed/ Mach.

EO MAX ALTITUDE

Ident.: EFB-IFT-30-00022823.0001001 / 02 OCT 19
Applicable to: ALL

The FMS Engine Out Maximum (EO MAX) altitude is a precomputed value, function of the aircraft gross weight and DISA, displayed on all the PERF pages if one engine is inoperative.

L2 **EO MAX** altitude respects the following criteria:
- It can be flown with LRC speed
- It can be held in level flight with:
  - The operating engine at "Maximum Continuous Thrust" rating
  - The failed engine in windmilling
  - Anti-ice OFF
- It can be reached before buffeting with a margin of 0.3 g
- It is less than the maximum certified altitude.

HOLDING

Ident.: EFB-IFT-30-00022824.0001001 / 02 OCT 19
Applicable to: ALL

In CONF CLEAN, the standard EO holding speed is the Green dot.

The landing performance calculation enables:
- At dispatch, to check that the aircraft can land at destination for the predicted conditions, in compliance with the regulatory requirements
- During flight, to check that the aircraft can land at destination for the actual conditions.

L2 The landing performance calculation is made with the landing performance (LDG PERF) application.

LANDING PARAMETERS

Ident.: EFB-LDG-10-00022779.0001001 / 02 OCT 19
Applicable to: ALL

The landing performance parameters are:

- The characteristics of the runway
  - L2 Landing Distance Available (LDA)
  - Elevation
  - Slope
  - Missed approach gradient.
- L1 The regulatory requirements
- The outside conditions
  - L2 Wind

    L3 As per regulation, the computation is based on 150 % of the entered tailwind, and 50 % of the entered headwind.
    The crosswind component does not affect the calculation of the landing distance. However, a maximum crosswind component is associated with each runway condition.
    For more information about crosswind limitation, *Refer to LIM-AG-OPS Crosswind Takeoff and Landing*.
  - L2 Outside Air Temperature (OAT)
  - Sea level atmospheric pressure (QNH)
  - Icing conditions (anti-ice selection)
  - Runway condition, or landing performance level.
- L1 The aircraft configuration
  - L2 Landing Weight (LW)
  - Aerodynamic configuration
  - Air conditioning setting
  - Aircraft CG position
  - Approach speed and go-around speed.
- L1 The aircraft status.
  - L2 MEL items
  - CDL items
  - Abnormal and emergency configuration (ABN EMER) for in-flight computation only.

L1 The following parameters can be optimized:

- Aerodynamics configuration
- Go-around speed.

L2 For more information about the go-around speed, *Refer to EFB-LDG-20 Landing Speeds*.

Intentionally left blank

LANDING SPEEDS

Ident.: EFB-LDG-20-00022780.0001001 / 02 OCT 19
Applicable to: ALL

LOWEST SELECTABLE SPEED (VLS)

VLS is the lowest selectable speed. VLS is used to determine the Final Approach Speed (VAPP) in normal conditions.
For more information about VLS, *Refer to DSC-22_10-50-20 Characteristic Speeds*.

REFERENCE SPEED (VREF)

VREF is equal to the VLS of CONF FULL. VREF is used to determine the Final Approach Speed (VAPP) when a system failure affects the landing performance.
For more information about VREF, *Refer to DSC-22_10-50-50 Other Speeds*.

FINAL APPROACH SPEED (VAPP)

VAPP is the speed of the aircraft when crossing the runway threshold. The flaps/slats are in the landing configuration, and the landing gears are extended.
For more information about VAPP, *Refer to DSC-22_10-50-50 Other Speeds*.

GO-AROUND SPEED

In the case of a missed approach, the go-around climb gradient is calculated at the go-around speed.
The standard go-around speed is 1.23 VS1G of the go-around configuration. For approaches with a decision height at or above 200 ft, where approach climb performance is found restrictive, the go-around speed can be increased up to a maximum limit. For more information about maximum go-around acceleration speed, *Refer to AFM/PERF-LDG Approach Climb and Landing Climb*.

Applicable to: ALL

REQUIRED LANDING DISTANCE

The RLD is the regulatory reference to be used for dispatch landing performance computation.

The RLD is the factored certified landing distance based on:
- Maximum manual braking initiated immediately after main gear touchdown
- Prompt selection of max reverse thrust, maintained to 70 kt, and idle thrust to full stop (when reverse thrust is taken into account)
- Antiskid system and all ground spoilers operative
- The regulatory dispatch factor.

Note: *The RLD calculation considers the effect of the MEL/CDL items that affect the landing performance.*

IN-FLIGHT LANDING DISTANCE

The In-Flight Landing Distance reflects the performance achievable in a typical operational landing without margin.

The In-Flight Landing Distance calculation assumes:
- An airborne phase of 7 s from threshold to touchdown
- In the case of manual braking: maximum manual braking initiated immediately after main gear touchdown
- In the case of autobrake: normal system delays in braking activation
- Antiskid system and all ground spoilers operative
- Prompt selection of max reverse thrust, maintained to 70 kt, and idle thrust to full stop (when reverse thrust is taken into account).

Note: *The In-Flight Landing Distance calculation considers the effect of the inoperative system(s) following:*
- *An MEL/CDL dispatch that affects the landing performance*
- *An in-flight failure (ECAM alert) that affects the landing performance.*

Note: *The In-Flight Landing Distance fulfills the requirements of the Landing Distance at Time of Arrival (LDTA) described in Air Ops AMC1 CAT.OP.MPA.303(e).*

FACTORED IN-FLIGHT LANDING DISTANCE

The definition of the In-Flight Landing Distance does not include any margin. The In-Flight Landing Distance is a realistic distance achievable in nominal conditions, i.e. the actual conditions during the landing are those used for the computation.

It is recommended to apply an appropriate margin to the In-Flight Landing Distance (either determined with or without failure) in order to cover:
- The variability in flying techniques (e.g. flare execution, delay in application of the deceleration means)
- Unexpected conditions at landing (e.g. real runway friction vs. reporting, turbulence, crosswind).

L2 The FLD is defined as:
- The In-Flight Landing Distance multiplied by a Factor, or
- The In-Flight Landing Distance plus an Increment.

L1 It is the airlines responsibility to define the margins (and their applicability) to apply on top of the In-Flight Landing Distance.
The recommended margin is a Factor of 1.15 on the In-Flight Landing Distance. In an emergency situation, the flight crew may decide to disregard this margin.

ROW ◁ LANDING DISTANCE

The ROW ◁ landing distance is calculated below 400 ft based on:
- The detected runway
- The current outside condition (e.g QNH, Temperature…)
- Dry and wet runway conditions
- A realistic manual or automatic landing, normal flare, and de-rotation technique
- Maximum braking
- IDLE REV, when runway condition/braking action is assumed to be DRY-6
- MAX REV, when runway condition/braking action is assumed to be WET-5.

Intentionally left blank

DRY RUNWAY

Ident.: EFB-LDG-30-00022783.0001001 / 28 MAY 20
Applicable to: ALL

A runway is dry when its surface is:
- Free of visible moisture
- Not contaminated.

WET RUNWAY

Ident.: EFB-LDG-30-00022784.0001001 / 15 NOV 21
Applicable to: ALL

A runway is considered as wet, when the surface is covered by any visible moisture or water up to and including 3 mm (1/8 in) depth. When the water film does not exceed 3 mm (1/8 in), there is no significant danger of hydroplaning.

Note: *1. A damp runway is considered wet, regardless of whether or not the surface has a shiny appearance.*
2. A runway is considered slippery wet when a significant portion of its surface does not comply with the applicable minimum friction criteria.

CONTAMINATED RUNWAY

Ident.: EFB-LDG-30-00022785.0001001 / 03 NOV 22
Applicable to: ALL

A runway is contaminated when a significant portion (depending on the applicable regulation) of its surface is covered with:
- A layer of fluid contaminant not considered as thin
- A hard contaminant.

DESCRIPTION OF FLUID CONTAMINANTS

In terms of performance, a contaminated runway is a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8 in). The fluid contaminant can be either:
- Dry snow
- Wet snow
- Standing water
- Slush.

Fluid Contaminants reduce friction forces, and cause:
- Precipitation drag
- Hydroplaning.

L2 Fluid contaminants descriptions:
- Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
- Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
- Standing water occurs due to heavy rain and/or not sufficient runway drainage. Standing water has a depth of more than 3 mm (1/8 in).
- Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures of approximately 5 °C, and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).

L1 DESCRIPTION OF HARD CONTAMINANTS

In terms of performance, a contaminated runway is a runway covered by a hard contaminant that can be either:
- Compacted snow
- Ice (Cold and Dry)
- Wet ice.

Hard contaminants only reduce friction forces.

L2 Hard contaminants descriptions:
- Compacted snow: the maintenance personnel use a snow groomer to compress the snow on a runway in order to obtain a hard surface
- Ice (Cold and Dry): situation in which ice occurs on the runway in cold and dry conditions
- Wet ice: when the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

L1 LANDING PERFORMANCE CALCULATION

L2 COMPUTATION ASSUMPTIONS

The following assumptions are considered for the calculation:
- The contaminant covers the entire length of the runway
- For fluid contaminants, the landing distance calculation does not take credit of the precipitation drag.

L1 EQUIVALENCES

In terms of performance:
- A fluid contamination is equivalent to wet, up to a maximum depth of 3 mm (1/8 in) of:
  - Dry snow
  - Wet snow
  - Standing water
  - Slush.
- Frost is equivalent to wet, unless a lower runway performance code is reported
- Slippery wet is equivalent to Dry snow
- Compacted snow with OAT above -15 °C is equivalent to Dry snow

  Note: *Compacted snow is appropriate for OAT at or below -15 °C.*

- Dry snow over compacted snow is equivalent to Dry snow
- Wet snow over compacted snow is equivalent to Wet snow.

Note:
- *In the case of a downgraded RWYCC for dispatch computation, Airbus recommends to perform the landing computation with a contaminant included in this RWYCC's category in the RCAM.*
- *In case of a downgraded or upgraded RWYCC, the flight crew should use the recommendations applicable to in-flight performance calculation. For more information, Refer to FCTM/LANDING PERFORMANCE / DOWNGRADED OR UPGRADED RWYCC.*

RESTRICTIONS

For maximum depth of fluid contaminants, *Refer to EFB-LDG-30 Runway Condition Assessment Matrix for Landing*.
Dispatch to a runway covered with wet ice is not permitted, unless a specific method for performance assessment has been established by the operator.
Refer to the AFM for further guidance.

RUNWAY CONDITION ASSESSMENT MATRIX FOR LANDING

GENERAL

Ident.: EFB-LDG-40-00022788.0001001 / 02 OCT 19
Applicable to: ALL

LANDING PERFORMANCE CALCULATION

The landing performance calculation is made with the landing performance (LDG PERF) application, with the computation type set to DISPATCH.

REQUIREMENT ON THE LANDING DISTANCE

The Landing Distance Available (LDA) at destination must be at least equal to the Required Landing Distance (RLD) for the planned landing weight.

REQUIREMENT ON THE GO-AROUND PERFORMANCE

The go-around climb gradient must be at least equal to:
- 2.1 %
- The gradient published in the airport approach chart.

Note: *EU-OPS requires a minimum go-around climb gradient of 2.5 % for instrument approaches with decision heights below 200 ft.*

DISPATCH ON DRY RUNWAY

Ident.: EFB-LDG-40-00022789.0001001 / 02 OCT 19
Applicable to: ALL

Landing performance is calculated without the benefit of thrust reversers, as per regulation.
L2 For information, the AFM publishes the autoland landing distance increments on dry runways.

DISPATCH ON WET RUNWAY

Ident.: EFB-LDG-40-00022790.0001001 / 02 OCT 19
Applicable to: ALL

Landing performance is calculated without the benefit of thrust reversers, as per regulation.
The RLD for a wet runway is the RLD for the dry runway multiplied by 1.15.

DISPATCH ON CONTAMINATED RUNWAY

Ident.: EFB-LDG-40-00022791.0001001 / 02 OCT 19
Applicable to: ALL

Landing performance can be calculated with the benefit of the thrust reversers.
For operators complying with EU-OPS regulation, the landing weight on a contaminated runway cannot exceed the landing weight on a wet runway.

DISPATCH WITH MEL OR CDL ITEM

Ident.: EFB-LDG-40-00022792.0001001 / 02 OCT 19
Applicable to: ALL

The aircraft can be dispatched with deferred MEL or CDL items. In this case, the LDA must be at least equal to the RLD calculated with the applicable MEL or CDL item selected.

MEL or CDL items that affect landing performance are:
- MEL items that reduce braking capabilities (brakes, spoilers, thrust reversers if applicable)
- MEL items that have an impact on thrust available for go-around (engine anti-ice valve stuck open)
- CDL items that increase aircraft drag (seals, fairings).

L2 CDL items are divided in two categories: negligible and non-negligible items.
If the number of negligible CDL items is less or equal to three, no penalty applies.
If the number of negligible CDL items is more than three, a drag increase for each item is applied.

IN-FLIGHT LANDING DISTANCE CROSSCHECK

Ident.: EFB-LDG-40-00022793.0001001 / 15 NOV 21
Applicable to: ALL

The FLD may, in some cases, and particularly on contaminated runway, exceed the RLD considered at dispatch.
The requirements at dispatch remain unchanged and are based on the RLD. It is however recommended to make a preliminary calculation of the FLD at dispatch. Based on this crosscheck, the crew only need to perform a computation during Descent Preparation in case of changes since dispatch.
If the FLD exceeds the LDA at destination, the Operator may limit the planned weight at destination by the maximum between the RLD and the FLD. The Operator may also consider suitable destination alternates.

ROW ◁ LANDING DISTANCE CROSSCHECK

Ident.: EFB-LDG-40-00023087.0001001 / 28 MAY 20
Applicable to: ALL

The ROW ◁ landing distance may, in some cases, exceed the RLD considered at dispatch.
If the conditions remain unchanged, the flight crew will not be authorized to initiate an approach (unless a specific authorization is obtained from the appropriate authority to deactivate the ROW/ROP ◁).
As a consequence, the dispatch conditions should be adapted in order to prevent a ROW ◁ alert to be triggered.

GENERAL

Ident.: EFB-LDG-50-00022795.0001001 / 15 NOV 21
Applicable to: ALL

During flight, the flight crew performs a landing performance computation if the landing conditions changed compared with the landing performance computation at dispatch, or with a previous computation (e.g. runway, weather conditions, in-flight failure affecting performance, diversion).
The landing performance calculation is made with the landing performance (LDG PERF) application, with the computation type set to IN-FLIGHT.
The landing distance used for this computation is the FLD. The flight crew uses the RCAM to determine the landing performance level.
If the aircraft has been dispatched with deferred MEL or CDL items, the In-Flight Landing Distance and FLD must be calculated with the applicable MEL or CDL items selected.
In an emergency situation, the flight crew may decide to disregard the FLD. In this case the flight crew must check that the In-Flight Landing Distance is shorter than the LDA at the destination or diversion airport.

L2 For more information on In-Flight Landing Distances, *Refer to EFB-LDG-20 Landing Distances Definitions* .

LANDING PERFORMANCE WITHOUT IN-FLIGHT FAILURE

Ident.: EFB-LDG-50-00022796.0001001 / 02 OCT 19
Applicable to: ALL

LANDING PERFORMANCE CALCULATION

The flight crew enters the expected landing conditions and calculates the landing performance.

FLAPS LEVER POSITION

The FLAPS lever position for landing is at flight crew's discretion.

VAPP DETERMINATION

VAPP is calculated by the FMS and is displayed on the APPR panel of the FMS PERF page.

L2 The VAPP is calculated by the FMS as the maximum of:
- VMCL + 5 kt
- 1.23*VS1G + APPR COR

APPR COR is the highest of
- 5 kt in case of A/THR ON
- 5 kt in case of Ice Accretion
- 1/3 Headwind component (excluding gust - maximum 15 kt).

LANDING PERFORMANCE FOLLOWING IN-FLIGHT FAILURE

Ident.: EFB-LDG-50-00022798.0001001 / 02 OCT 19
Applicable to: ALL

LANDING PERFORMANCE ECAM INDICATIONS

After an aircraft system failure that occurs in flight, the flight crew follows the associated ECAM procedure.
When required, the ECAM displays landing performance indications in the applicable procedure.
The ECAM alert items are displayed on the ECAM STATUS page. The ECAM displays LDG DIST PROC APPLY if an ECAM alert item affects landing performance.

LANDING PERFORMANCE CALCULATION

The flight crew enters the ECAM alerts item that affect performance and expected landing conditions in the LDG PERF application to calculate the landing performance.

FLAPS LEVER POSITION

The flight crew selects the FLAPS lever position requested by the ECAM.

Note: *If there are no ECAM instructions, the FLAPS lever position for landing is at flight crew's discretion.*

VAPP DETERMINATION

- **If the ECAM displays LDG DIST PROC APPLY:**
  The flight crew enters into the FMS - PERF - APPR page the VAPP value computed by the LDG PERF application.

ROW ◁ LANDING DISTANCE CROSSCHECK

Ident.: EFB-LDG-50-00022800.0001001 / 28 MAY 20
Applicable to: ALL

The ROW ◁ landing distance may, in some cases, exceed the factored in-flight landing distance.
The flight crew will not be authorized to initiate an approach if a ROW ◁ alert is expected (unless a specific authorization is obtained from the appropriate authority to deactivate the ROW/ROP ◁).
If a ROW ◁ alert is expected, and the flight crew is not authorized to deactivate the ROW/ROP ◁ , the flight crew should request to change the runway, or initiate a diversion.
